### 1. Introduction

This Sustainability Management Plan (SMP) has been prepared to assist the design, construction and operation of the proposed mixed-use development at 10-16 Selwyn Street, Elsternwick to achieve a range of best-practice sustainable development objectives. Sustainable Development Consultants have assessed the proposed plans and coordinated with the project team to incorporate ESD initiatives to ensure that the development meets the sustainability requirements of the City of Glen Eira, in particular Local Planning Policy *Clause 15.01-2L-02 Environmentally Sustainable Development, Clause 53.18 Stormwater Management in Urban Development and Clause 58 Apartment Developments* and the Sustainable Design Assessment in the Planning Process (SDAPP<sup>1</sup>) requirements.

### 1.1 Site and Development Description

The site at 10-16 Selwyn Street, Elsternwick, occupies a total area of approximately 5,700 m<sup>2</sup> and is located approximately 10 km south-east of the Melbourne CBD. It is positioned within a vibrant, well-established commercial precinct that blends retail, hospitality, and residential uses.

Surrounding the site is a mixture of low- to medium-rise buildings, many of which accommodate shops, cafes, and offices, contributing to the active street frontage in the area. The site is easily accessible via public transport, with nearby tram and train services providing direct connections to the broader Melbourne metropolitan area.

The local streetscape features a combination of modern and traditional architectural styles, reflecting the ongoing development of the Elsternwick neighbourhood. The site's strategic location offers proximity to key amenities, including parks, schools, and recreational facilities, making it an attractive setting for a mixed-use development.

The proposed development is an eleven-storey building above four levels of basement car parking. It comprises two shop/food and drink premises, a BWS, and a supermarket on the ground level; a supermarket office, an office tenancy, seven residential apartments on the mezzanine level; and residential apartments from Level 1 to Level 9. A total of 148 apartments and 423 car parking spaces are proposed.

### The development summary is as follows:

| Area Type          | Inclusions   |
|--------------------|--|
| Total Site Area    | 5,700m <sup>2</sup>  |
| Basement 1-4       | 423 x Car parking spaces   |
| Ground Level       | 3,477m <sup>2</sup> Supermarket<br>271m <sup>2</sup> Place of assembly<br>32m <sup>2</sup> Shop or food and drink premises<br>105m <sup>2</sup> Shop or food and drink premises<br>156m <sup>2</sup> BWS                 |
| Mezzanine Level    | 219m <sup>2</sup> Supermarket office<br>312m <sup>2</sup> Office<br>400m <sup>2</sup> Place of assembly  |
| Level 1 to Level 9 | <ul> <li>827m<sup>2</sup> Communal open space</li> <li>195m<sup>2</sup> Internal common area</li> <li>45 x One-bedroom apartments</li> <li>62 x Two-bedroom apartments</li> <li>41 x Three-bedroom apartments</li> </ul> |

### 1.2 Glen Eira City Council Requirements

The City of Glen Eira promotes the concept of sustainability and the adoption of sustainable energy options and environmental design practices. Critical to achieving this commitment is for development to meet appropriate environmental design standards.

The Glen Eira City Council expects that this project should achieve best practice in environmentally sustainable development from the design stage through to construction and operation. To comply with the Local Planning Scheme including Clause 15.01-2L-02 Environmentally Sustainable Development, this project is required to satisfy the objectives as set out within the following categories, where applicable:

- Integrated water management
- Indoor environment quality
- Transport
- Urban ecology

This requires a Sustainability management Plan (SMP) which demonstrates how for this project, the relevant policy objectives will be achieved.

The City of Glen Eira also requires that this project addresses the following planning scheme provisions:

- Clause 19.03-3S Integrated Water Management
- Clause 52.34 Bicycle Facilities
- Clause 53.18 Stormwater Management in Urban Development
- Clause 58.03-1 Energy Efficiency Objectives
- Clause 58.06-3 Waste and Recycling Objectives
- Clause 58.07-4 Natural ventilation objectives

In May 2020, the City of Glen Eira declared a climate emergency and as part of this, are committed to enhanced Environmentally Sustainable Design.

1.3 ESD Assessment Tools

There are several calculators and modelling programs available in Victoria to assess proposed developments against benchmarks set by the Victorian government, local councils and the Building Code of Australia.

For this SMP, the following tools have been used to assess different aspects of the development:

- Built Environment Sustainability Scorecard (BESS) which covers the overall sustainability of the development;
- FirstRate5 which covers the energy efficiency performance of the building fabric; and
- Model For Urban Stormwater Improvement Conceptualisation (MUSIC assessment), which addresses stormwater quality considerations for the entire development.

All tools have minimum compliance requirements. MUSIC and FirstRate5 have requirements that are mandatory for Victoria. The BESS tool is typically used to demonstrate that a development meets sustainability benchmark requirements as part of a planning permit application for the participating council.

### 1.3.1 BUILT ENVIRONMENT SUSTAINABILITY SCORECARD (BESS)

BESS was developed by the Council Alliance for a Sustainable Built Environment (CASBE). This tool assesses the energy and water efficiency, thermal comfort and overall environmental sustainability performance of new buildings or alterations. It was created to demonstrate that new developments meet sustainability requirements as part of a planning permit application.

A BESS assessment has been conducted for the proposed development. This provides a guide as to the level of sustainability achieved by the proposed development in line with the Glen Eira City Council's ESD requirements.

Each target area within the BESS tool generally receives a score of between 1% and 100%. A minimum score of 50% is required for the energy, water, stormwater and IEQ areas. An overall score of 50% for the project represents 'Best Practice' while a score over 70% represents 'Excellence'.

The results for the BESS Assessment can be found in Appendix 1.

### 1.3.2 FIRSTRATE5

The energy efficiency of the dwellings will be assessed using FirstRate5, which is an energy modelling software program to rate apartments/other dwellings on a 10-Star scale. The tool uses the Chenath engine (as a nationally recognised energy benchmarking) to rate dwellings based on climate zone, materials used in a structure, positioning and orientation and building sealing. Higher scores are achieved primarily through better material selection, improvements in glazing, and insulation. It is noted that the 2019 Building Code of Australia (BCA) will apply to this development.

The results of the FirstRate5 assessment can be found in Appendix 2 of this report.

### 1.3.3 MODEL FOR URBAN STORMWATER IMPROVEMENT CONCEPTUALISATION V6 (MUSIC)

MUSIC is an urban stormwater modelling software that was developed to provide an easy-to-use universal treatment model for all urban stormwater systems. The tool is capable of simulating stormwater runoff, its treatment and quality during a rainfall event for catchment areas up to 100km<sup>2</sup> and can be used to assess and inform on stormwater treatment measures necessary to ensure the design of urban development meet required Water Sensitive Urban Design Standards.

Details and results for the MUSIC assessment completed for the proposed development can be found in Appendix 3 of this report.

### 2. Sustainability Initiatives

The following sections outline the initiatives which will be included in the development and implemented throughout the design and construction process. These sections, as well as nominating the sustainability initiatives, also identify the party/parties responsible for implementation of the initiative, and the stage at which implementation will be demonstrated. The following are the broad project stages:

| 1 | Design Development         | <ul> <li>Consultants develop conceptual design drawing to a detailed stage suitable as a basis for preparing working drawings - Integration of architectural, services, structure and site attributes</li> <li>Checking compliance with all statutory requirements, codes and standards</li> <li>Arranging special surveys or reports as required</li> </ul> |
|---|----------------------------|--|
| 2 | Construction Documentation | <ul> <li>Architectural and services drawing sets completed</li> <li>All specialist reports completed</li> <li>All necessary planning and building consents obtained as required by authorities</li> </ul>  |
| 3 | Construction               | <ul> <li>All work carried out onsite – site preparation, construction, alteration, extension, demolition</li> <li>Purchase of all materials / certification</li> <li>Evidence gathering from sub-contractors</li> <li>Commissioning</li> </ul>   |
| 4 | Post Occupancy             | <ul> <li>Operation and Maintenance</li> <li>Education – Building Users Guides</li> </ul>   |

### 2.1 Energy Performance

| Design Requirements  | Responsibility &<br>Implementation | Project Stage  |
|--|------------------------------------|--|
| Energy Efficiency – For Residential (BESS Energy 1.2; BESS Management 2.2)   |                                    |  |
| The residential apartments will be designed to achieve an average rating of at least 6.5-stars, with all individual dwellings scoring at least 5-stars in the NatHERS performance rating.  | Architect                          | Design   |
| This commitment will be demonstrated through sample energy ratings that confirm the building fabric required to achieve this outcome.  |                                    | Development  |
| Energy Efficiency – For Non-Residential (BESS Energy 1.1)  |                                    |  |
| The proposed shop/food and drink premises, supermarket, offices and place of assembly will be designed with high-performance building fabric and glazing to meet the Part J Deemed-to-Satisfy requirements of BCA 2019.  |                                    |  |
| In addition to meeting the Part J Deemed-to-Satisfy requirement of BCA 2019, the development will also comply with the Deemed-to-Satisfy criteria for BESS Energy 1.1. This requires all exposed floors and ceilings (forming part of the envelope) to meet the required NCC 2019 insulation levels (total R-value upwards and downwards).               | Architect                          | Design<br>Development /<br>Construction<br>Documentation |
| Additionally, all walls and glazing which form part of the building envelope will be required to meet the NCC 2019 facade calculator requirement.  |                                    |  |
| Heating and Cooling Systems – Non-residential (BESS Energy 2.1 & 2.7)  |                                    |  |
| Heating and cooling within the non-residential areas of the development will<br>be provided by energy efficient air conditioners of minimum of one star of<br>the best energy rating available for the capacity of the selected air-<br>conditioning unit or have COP/EER not less than 85% of the most efficient<br>equivalent capacity unit available. | Services<br>Engineer               | Design<br>Development /<br>Construction<br>Documentation |
| Heating and Cooling Systems – Residential (BESS Energy 2.1 & 2.7)  |                                    |  |
| Each apartment will be provided by energy efficient split system air conditioners, selected with a minimum Zoned Energy Rating Label (ZERL) efficiency of 1.5 Star for Heating and 2 Star for Cooling, or a minimum rating of 3-star energy rating under the older scheme.   | Services<br>Engineer               | Design<br>Development /<br>Construction<br>Documentation |
| Building Sealing   |                                    |  |
| All windows, doors, exhaust fans and pipe penetrations will be constructed<br>to minimise air building leakage as required by the provisions outlined in<br>Section J3 of the 2019 BCA.  | Architect/                         | Design   |
| This will include the use of seals around operable windows and doors as well<br>as caulking to pipe penetrations, and the addition of self-closing louvers or<br>dampers to exhaust fans.  | Builder                            | Development  |
| External Lighting  |                                    |  |
| Lighting to external areas will either be LED and will be operated by controls,<br>such as motion detectors, to minimise consumption during off-peak times<br>(e.g. 11pm-5am).   | Architect/<br>Services<br>Engineer | Construction<br>Documentation                            |
| Hot Water Services (BESS Energy 3.2 & 2.1)   |                                    |  |
| Hot water for the development will be provided via electric heat pump hot water system.  |                                    |  |
| The water heating systems servicing the non-residential component must be within one star of the best available, or at least 85% or better than the most efficient equivalent capacity unit.   | Services<br>Engineer               | Design<br>Development                                    |

10-16 SELWYN STREET, ELSTERNWICK | S5111 | SMP.V1

| Design Requirements   | Responsibility &<br>Implementation | Project Stage                 |  |
|---|------------------------------------|-------------------------------|--|
| Internal Lighting – Non-Residential (BESS Energy 3.7)   |                                    |                               |  |
| <ul> <li>Energy consumption from artificial lighting within the proposed non-residential spaces will be reduced by using LED lighting. The maximum illumination power density (W/m<sup>2</sup>) in at least 90% of the area of the relevant building class will meet the requirements in Table J6.2a of the NCC 2019 Vol 1, that is:</li> <li>Office – Less than 4.5W/m<sup>2</sup></li> <li>Corridor - Less than 5W/m<sup>2</sup></li> <li>Shop and tenancy – Less than 14W/m<sup>2</sup></li> <li>Place of Assembly – Less than 3W/m<sup>2</sup></li> <li>Amenities – Less than 8W/m<sup>2</sup></li> </ul> | Architect/<br>Services<br>Engineer | Design<br>Development         |  |
| Motion sensors will be installed in all areas with sporadic use, such as service rooms.   |                                    |                               |  |
| Internal Lighting – Residential Apartments (BESS Energy 3.6)  |                                    |                               |  |
| <ul> <li>Energy consumption from artificial lighting within the proposed non-residential spaces will be reduced by using LED lighting. The maximum illumination power density (W/m<sup>2</sup>) in at least 90% of the apartment will be at least 20% lower than required by Table J6.2a of the NCC 2019 Vol 1, that is:</li> <li>Apartments - Less than 4W/m<sup>2</sup></li> </ul>  | Architect/<br>Services<br>Engineer | Design<br>Development         |  |
| Carpark Ventilation   |                                    |                               |  |
| The basement carpark ventilation will be designed to best practice energy efficiency with all exhaust fans being installed with Carbon Monoxide (CO) sensors to ensure they only operate when necessary.  | Mechanical<br>Engineer             | Construction<br>Documentation |  |
| PV Panels (BESS Energy 4.2)   |                                    |                               |  |
| The rooftop will host a 40kW (min.) system for renewable energy generation.<br>This will offset a portion of greenhouse gas emissions annual energy use in<br>the development by producing over 52,122kWh of green electricity per<br>year <sup>2</sup> .   | Electrical<br>Engineer             | Construction<br>Documentation |  |
| Clothes Drying (BESS Energy 3.4)  |                                    |                               |  |
| The development will provide permanent indoor clotheslines (minimum 4 meters per bedroom) for all dwellings. This helps to reduce the reliance on using dryers to dry clothes, which is energy-intensive.   | Architect                          | Design<br>Development         |  |

### 2.2 Water Efficiency and Water Sensitive Urban Design

Water will be used efficiently in the development through installation of efficient fixtures and fittings, and collection and reuse of rainwater, which helps to reduce mains water requirements and diverts stormwater from drains during rainfall events.

| Design Requirements  | Responsibility &<br>Implementation | Project Stage         |
|--|------------------------------------|-----------------------|
| Fixtures and Fittings (BESS Water 1.1)   |                                    |                       |
| The development will include efficient fittings and fixtures to reduce the volume of mains water used in the development. The following Water Efficiency Labelling Scheme (WELS) minimum star ratings will be specified:<br>• Toilets – 4 Stars: | Architect                          | Design<br>Development |

 $<sup>^{\</sup>rm 2}$  Energy generation estimate calculated as per BESS Energy 4.2.

| Design Requirements  | Responsibility &<br>Implementation     | Project Stage         |
|--|--|-----------------------|
| <ul> <li>Dishwashers – 5 Stars;</li> <li>Bath – Medium Sized Contemporary Bath (where provided);</li> <li>Taps (bathroom) – 5 Stars;</li> <li>Taps (kitchen) – 5 Stars; and</li> <li>Showerheads – 4 Stars (&gt;6.0 but ≤7.5L/min).</li> </ul>   |  |                       |
| Rainwater Collection & Reuse (BESS Water 1.1; BESS Stormwater 1.1 & MUSIC Requirement)   |  |                       |
| Rainwater runoff from the non-trafficable roof areas, totalling a minimum of 2,040m <sup>2</sup> will flow into a 70kL rainwater tank that will be used for flushing toilets on the apartments from mezzanine level to level 3. Overflow of the rainwater tank will be diverted to PSorb StormFilters before entering the legal point of discharge.<br>Overflow of the exposed landscaped area, totalling 1,021m <sup>2</sup> , will be diverted to PSorb StormFilters before entering the legal point of discharge. The remaining impervious pavement area within the site will be diverted to OceanGuard and then to PSorb StormFilters before entering the legal point of discharge.<br>Refer to Appendix 3 for MUSIC assessment and WSUD analysis. | Hydraulics<br>consultant/<br>Architect | Design<br>Development |
| Water Efficient Landscaping (BESS Water 3.1)   |  |                       |
| Native and drought tolerant plants will be used for landscaped areas installed<br>on site. These will not require irrigation following the establishment period.   | Landscape<br>Architect                 | Design<br>Development |
| Waterless HVAC System (BESS Water 4.1)   |  |                       |
| Air-conditioning units will use air-cooled condenser components which will<br>help to reduce the developments overall water usage, while also preventing<br>the growth of legionella bacterium which thrive in warm stagnant water.  | Mechanical<br>Engineer                 | Design<br>Development |
| Fire System Test Water (BESS Water 4.1)  |  |                       |
| Fire system test water will be captured and re-used, or a fire system that does not expel water for testing will be installed. If discharged water is captured for reuse, at least 80% of water will be captured per test.   | Service<br>Consultant                  | Design<br>Development |

### 2.3 Indoor Environmental Quality

| Design Requirements   | Responsibility & Implementation | Project Stage                 |
|---|---------------------------------|-------------------------------|
| Volatile Organic Compounds (VOCs) (BESS IEQ 4.1)  |                                 |                               |
| All paints, adhesives and sealants, and flooring (including carpet) will not exceed limits outlined in Appendix 4. Alternatively, products will be selected with no VOCs.   | Architect                       | Construction<br>Documentation |
| Formaldehyde Minimisation (BESS IEQ 4.1)  |                                 |                               |
| All engineered wood products will have 'low' formaldehyde emissions,<br>certified as E0 or better. Alternatively, products will be specified with no<br>formaldehyde. Emissions limits are listed in Appendix 4.  | Architect                       | Construction<br>Documentation |
| External Shading (BESS IEQ 3.4)   |                                 |                               |
| Almost all west and north-facing glazing to shops and places of assembly on<br>ground level are appropriately shaded by deep eave overhangs above.<br>West and north-facing glazing in places of assembly on the mezzanine level<br>are also provided with overhangs above to reduce peak summer heat gain. | Architect                       | Construction<br>Documentation |

10-16 SELWYN STREET, ELSTERNWICK | S5111 | SMP.V1

| Design Requirements  | Responsibility &<br>Implementation | Project Stage                 |
|--|------------------------------------|-------------------------------|
| Ventilation – Non-Residential (BESS IEQ 2.3)   |                                    |                               |
| The ventilation systems in the shop/food and drink premises, supermarket, offices and place of assembly are to be designed to achieve, monitor, and maintain a maximum CO <sub>2</sub> concentration of maximum 800ppm to regular use areas.<br>The shop/food and drink premises, supermarket, offices and place of assembly will be designed with at least 50% outdoor air improvement to regular use areas compared to the minimum required by AS 1668.2:2012.   | Architect                          | Construction<br>Documentation |
| Double Glazing   |                                    |                               |
| The apartments will be fitted with double glazed windows and double-glazed doors. The double glazing brings multiple benefits to the apartments, such as a better thermal performance and reduced condensation forming on the inside of the glass which will in turn help prevent the formation of mould.  | Architect                          | Construction<br>Documentation |
| Daylight Access – For Residential Apartments (BESS IEQ 1.1 & 1.2 & 1.5)  |                                    |                               |
| All the living rooms and bedrooms will be provided with at least one<br>operable external window. This allows sunlight to penetrate into the living<br>rooms and bedrooms and therefore enhance the thermal and visual comfort<br>of these rooms. Daylight assessment result indicates that 80% of living areas<br>achieve a daylight factor greater than 1% whilst 94% of bedrooms achieve a<br>daylight factor greater than 0.5%.  | Architect                          | Construction<br>Documentation |
| Daylight Access – For Non-Residential (BESS IEQ 1.4)   |                                    |                               |
| The ground level and mezzanine level tenancies will be provided with an extensive number of windows on the external façade to optimise sunlight penetration into these spaces. The Green Star hand calculation assessment indicates that the design allows at least 33% of the nominated non-residential floor area to achieve a daylight factor of at least 2%. Refer to Appendix 5 for the Green Star Hand Calculation analysis.   | Architect                          | Construction<br>Documentation |
| Mechanical Ventilation   |                                    |                               |
| All kitchens will have a separate dedicated exhaust fan (range-hood) which will exhaust cooking fumes directly out of the building.  | Mechanical<br>Engineer             | Design<br>Development         |
| Effective Natural Ventilation (BESS IEQ 2.1)   |                                    |                               |
| All apartment dwellings will be fitted with operable windows to promote<br>natural air movement through the spaces. Most of the apartments have<br>layouts which are conducive with effective natural cross ventilation. These<br>apartments are designed with openings in adjacent and/or opposing walls<br>which improves natural ventilation through the creation of breeze paths<br>(<15m long).<br>89 out of the 148 apartments (equivalent to 60%) are dual aspect meeting<br>BESS effective natural ventilation requirements.<br>When weather conditions are suitable, natural ventilation can reduce the<br>need for mechanical cooling while also providing an opportunity for passive<br>air changes within the dwellings which helps reduce the potential build-up of<br>mould and other airborne toxins. | Architect                          | Design<br>Development         |

### 2.4 Building Materials

Materials initiatives help to reduce the use of virgin materials, reduce waste, and promote the use of materials with lower embodied energy and environmental impacts generally.

| Design Requirements   | Responsibility &<br>Implementation  | Project Stage                 |  |
|---|-------------------------------------|-------------------------------|--|
| Steel   |                                     |                               |  |
| Wherever possible, steel for the development will be sourced from a Responsible Steel Maker <sup>3</sup> . Reinforcing steel for the project will be manufactured using energy reducing processes.  | Builder /<br>Structural<br>Engineer | Construction<br>Documentation |  |
| Timber  |                                     |                               |  |
| All timber used in the development will be Forest Stewardship Council (FSC) or Program for the Endorsement of Forest Certification (PEFC) certified or recycled / reused.   | Builder                             | Construction<br>Documentation |  |
| Flooring  |                                     |                               |  |
| The use of timber flooring will be preferred for all living areas and bedrooms.<br>All flooring will be selected from products/materials certified under any of<br>the following:   |                                     |                               |  |
| <ul> <li>Carpet Institute of Australia Limited, Environmental Certification<br/>Scheme (ECS) v1.2;</li> <li>Ecospecifier GreenTag GreenRate v3.2; and/or</li> <li>Good Environmental Choice (GECA).</li> </ul>  | Builder                             | Construction<br>Documentation |  |
| Alternatively, flooring must be durable, include some eco-preferred content, be modular and/or come from a manufacturer with a product stewardship program and ISO 14001 certification.   |                                     |                               |  |
| Concrete  |                                     |                               |  |
| A minimum of 50% of the concrete mix will contain recycled water (rainwater or purchased recycled water).   | Builder /<br>Structural<br>Engineer | Construction<br>Documentation |  |
| Insulation  |                                     |                               |  |
| All bulk insulation installed in the development will include a minimum of 20% post-consumer recycled material.   | Architect                           | Construction<br>Documentation |  |
| Cables, pipes, floors and blinds  |                                     |                               |  |
| All standard uses of cables, pipes, flooring and blinds within the development will either not contain any PVC will be sourced from a manufacturer/supplier that meets the Green Building Council of Australia's <i>Best Practice Guidelines for PVC in the Built Environment</i> . | Services<br>Consultant              | Construction<br>Documentation |  |

<sup>&</sup>lt;sup>3</sup> A Responsible Steel Maker must have facilities with a currently valid and certified ISO 14001 Environmental Management System (EMS) in place and be a member of the World Steel Association's (WSA) Climate Action Program (CAP).

Figure 3: Examples of approved environmental labels which may be incorporated for the development.

### 2.5 Construction and Waste Management

| Design Requirements  | Responsibility &<br>Implementation | Project Stage                 |
|--|------------------------------------|-------------------------------|
| Operational Waste Storage (BESS Waste 2.1 & 2.2)   |                                    |                               |
| The development will provide separate waste storage area for commercial<br>and residential waste within the basement level. The recycling disposal will<br>be made equally convenient to general waste disposal.   |                                    |                               |
| In addition, there will be provision for Food / Organic (FOGO) waste bins, recycling future glass bins, charity bins, hard waste bins and electronic waste bins within the waste room as well.   | Architect/<br>Building<br>Owner    | Post<br>Construction          |
| All bins will be well marked and provide instructions for what waste types are acceptable in each bin.   |                                    |                               |
| Construction Waste Management Plan   |                                    |                               |
| The builder will develop a waste management plan for the pre-construction, civil works and construction phases. This will include the following:   |                                    |                               |
| <ul> <li>Waste generation;</li> <li>Any waste systems;</li> <li>Minimisation Strategy;</li> <li>Performance / Reduction targets;</li> <li>Bin quantity and size;</li> <li>Collection frequency;</li> <li>Waste contractors;</li> <li>Signage; and</li> <li>Monitoring and reporting including frequency and method.</li> </ul> | Builder                            | Construction<br>Documentation |

### 2.6 Transport

The proposed development site has been assessed using the "Walk Score" locational performance tool. The tool was developed in 2007 by Front Seat using the Google Maps tools. This tool takes into account the number of facilities within close proximity and provides a numerical score of between 1 and 100, with 1 being heavily car dependant with access to community facilities that are located some distance away, and 100 reflecting a location that is easily accessible to abundant facilities by foot.

The 10-16 Selwyn Street, Elsternwick site achieves a score of 97 out of 100, which is classified as "Walker's paradise". Scores of 60+ indicate that residents can complete most errands on foot.

10-16 SELWYN STREET, ELSTERNWICK | S5111 | SMP.V1

Figure 4: Walk score map and rating for 10-16 Selwyn Street, Elsternwick development site (Source: Walkscore)

| Design Requirements   | Responsibility & Implementation | Project Stage         |
|---|---------------------------------|-----------------------|
| Motorbikes / Mopeds parking (Bess Transport 2.3)  |                                 |                       |
| 22 Motorbike parking bays will be provided on Basement Level 4 to cater to the needs of motorbike owners, ensuring secure and convenient parking options within the premises.   | Architect                       | Design<br>Development |
| Public Transport  |                                 |                       |
| The proposed development has direct access within 2km walking distance to the following public transport options:   |                                 |                       |
| Train Line:   |                                 |                       |
| Elsternwick Station - Sandringham Train line  |                                 |                       |
| Bus Line:   |                                 |                       |
| <ul> <li>246 Elsternwick - Clifton Hill via St Kilda</li> <li>603: Brighton Beach - Alfred Hospital via Elsternwick Station</li> <li>604: Gardenvale - Alfred Hospital via Toorak Station</li> <li>606 Elsternwick Station - Fishermans Bend</li> <li>625: Elsternwick - Chadstone via Ormond &amp; Oakleigh</li> </ul> | Inherent in Location            |                       |
| Tram Line:  |                                 |                       |
| • Tram 67: Melbourne University – Carnegie  |                                 |                       |

| Design Requirements  | Responsibility 8     | & Implementation      |  |
|--|----------------------|-----------------------|--|
| Bicycle Parking and End of Trip Facilities - Non-Residential (BESS Transport 1.2,  | 1.4, 1.5 & 1.6)      |                       |  |
| The development will provide 127 bike parking spaces to be used by the building occupants (50 for residents and 30 for residential visitor, 35 for employee, 8 for shop/food and premises & supermarket visitors and 4 for place of assembly visitor).   | Architect            | Design<br>Development |  |
| End-of-trip facilities (including two showers and a minimum of 15 lockers) will be provided to the proposed development within the basement level.   |                      |                       |  |
| Electric Vehicle Charging (BESS Transport 2.1)   |                      |                       |  |
| 22 EV charging bays will be provided on Basement Level 4 to accommodate the growing demand for electric vehicle charging and support the transition to sustainable transportation.   |                      |                       |  |
| Additionally, the proposed building may include provisions that facilitate<br>easy installation of EV charging infrastructure when further demand arises.<br>This can be achieved by ensuring the electrical system is designed with<br>sufficient capacity and dedicated circuits for future EV chargers. Additionally,<br>conduits should be pre-installed to key parking areas to simplify the later<br>integration of charging stations. Strategic planning for meter placement, load<br>management systems, and potential energy upgrades—such as solar<br>integration or battery storage—will also enhance the building's readiness to<br>accommodate more EV charging needs as they evolve. | Services<br>Engineer | Design<br>Development |  |

### 2.7 Urban Ecology

| Design Requirements   | Responsibility & Implementation   | Project Stage                 |  |  |
|---|---|-------------------------------|--|--|
| Refrigerant Ozone Depleting Potential   |   |                               |  |  |
| All HVAC refrigerants used in the development will be selected to have an Ozone Depletion Potential (ODP) of zero.  | Mechanical<br>Engineer  | Construction<br>Documentation |  |  |
| Insulation Ozone Depleting Potential  |   |                               |  |  |
| All thermal insulation used in the development will not contain any ozone-<br>depleting substances and will not use any when being manufactured.  | Architect   | Construction<br>Documentation |  |  |
| Private Open Space (BESS Urban Ecology 2.4)<br>Balconies for each apartment will be provided with a tap and floor waste to<br>allow residents to grow plants on their balconies more easily.  | Architect /<br>Hydraulic  | Construction<br>Documentation |  |  |
| Green Walls and Facades (BESS Urban Ecology 2.3)  |   |                               |  |  |
| The north-east edge of the development will have two green façades<br>growing from ground level to the second floor. The façades will be trellis<br>structures that support living vines and climbing plants rooted in soil beds or<br>containers. These façades will not only improve the visual amenity of this<br>'dead' edge, but also improve the building's shade and thermal qualities.  | Landscape<br>Architect  | Design<br>Development         |  |  |
| The system will consist of vertical cables with tension wall anchor points to<br>stabilise the structure and maximise the plant health. All planters and garden<br>beds for these will be irrigated and mulched and designed to enable<br>maintenance work (via rope).  | sist of vertical cables with tension wall anchor points to<br>re and maximise the plant health. All planters and garden<br>be irrigated and mulched and designed to enable<br>(via rope). |                               |  |  |
| Communal Spaces and Green Roofs (BESS Urban Ecology 1.1 & 2.2)  |   |                               |  |  |
| The level 1 communal open space, totalling 827m <sup>2</sup> , provides the most significant on-structure landscaping area within the development.  |   |                               |  |  |
| Raised and mounded planters are provided to all on-structure gardens to<br>provide sufficient soil depth whilst following structural loading requirements.<br>The overall design intent for this area is to soften the building edge to<br>surrounding neighbourhood and create communal space for the residents to<br>access green space and enjoy areas of reflection and respite from the urban<br>environment.  |   |                               |  |  |
| To break the verticality of the architectural facade, the edges of these<br>communal spaces will wrap the building in continuous planting and<br>mounding foliage. This will also help in screening the internal private<br>residential apartments from this open public area. To assist with creating a<br>green oasis for residents, central islands of planting will break up the large<br>hardstand areas and create alternate paths and communal rest areas.<br>Together, this will create a series of organised spaces where residents can<br>choose to either commune or retreat amongst a green environment. The<br>intensity of planting and foliage will also be visually beneficial for those on<br>the streetscape level as they view the building. | Architect   | Design<br>Development         |  |  |

### 2.8 Building Management and Innovation

Initiatives included in management promote adoption of environmental initiatives at different stages of the project – not just in the project's design stage.

| Design Requirements   | Responsibility & Implementation | Project Stage                 |
|---|---------------------------------|-------------------------------|
| Building User's Guide (BESS Management 4.1)   |                                 |                               |
| A Building User's Guide will be developed for residents and staff. The<br>Building Users' Guide will run through how the BESS scores were achieved<br>and give ideas, tips and suggestions to make best use of the building in the<br>following areas:<br>Building Services<br>Energy Consumption: Monitoring and Targeting<br>Water Consumption: Monitoring and Targeting<br>Transport Facilities<br>Indoor Environment Quality<br>Waste Management<br>Expansion and Re-fit Considerations |                                 |                               |
| <ul> <li>Further information and references for sustainable lifestyle</li> </ul>  |                                 |                               |
| Building Services   |                                 |                               |
| This section will include (but not limited to) all the building services to be provided in this development, their purpose, capacity/efficiency and location.   |                                 |                               |
| Energy Consumption: Monitoring and Targeting  |                                 |                               |
| This section will include (but not limited to) all the energy efficient<br>appliances, efficient lighting fixtures, energy monitoring system, energy<br>targets and metering system to be provided in the development to reduce<br>energy consumption during operation stage. Included in this section are also<br>some tips to educate occupants how to save energy through behaviour<br>change.   | Architect /<br>Builder          | Construction<br>Documentation |
| Water Consumption: Monitoring and Targeting   |                                 |                               |
| This section will include (but not limited to) all the efficient water fixtures to<br>be provided in the development to reduce water consumption during<br>operation stage. Included in this section are also some tips to educate<br>occupants how to save water through behaviour change.   |                                 |                               |
| Transport Facilities  |                                 |                               |
| This section will include (but not limited to) several sustainable transport<br>options and facilities in and around 10-16 Selwyn Street, Elsternwick. This<br>helps residents to understand the sustainable transport options and facilities<br>in and around the development, while also encourages occupants to switch<br>their transportation mode into a more environmentally friendly manner.   |                                 |                               |
| Indoor Environment Quality  |                                 |                               |
| This section will detail several initiatives that have been included in the development to improve the quality of the indoor environment. Included in this section are also some tips to keep a healthy indoor environment through behaviour change.  |                                 |                               |
| Waste Management  |                                 |                               |

| Design Requirements   | Responsibility &<br>Implementation | Project Stage                 |
|---|------------------------------------|-------------------------------|
| This section will include (but not limited to) the location of the bin storage area in the development, waste disposal guidance, waste collection frequency and waste reduction tips. |                                    |                               |
| Expansion and Re-fit Considerations   |                                    |                               |
| Included in this section are some tips to keep the apartments/tenancies<br>environmentally friendly when residents/shop owners are considering<br>refitting their homes/shops.        |                                    |                               |
| Further information and references for sustainable lifestyle  |                                    |                               |
| This section will introduce other information in relation to sustainable lifestyle, which may be useful for residents.  |                                    |                               |
| Metering and Monitoring (Management 3.1, 3.2 & 3.3)   |                                    |                               |
| Separate utility meters (water and electricity) will be provided for each apartment, shop/food and drink premise, supermarket, office and place of assembly.                          | Services<br>Consultant             | Construction<br>Documentation |
| All common area services (e.g. common lighting, lifts, car park ventilation) will be separately sub metered.  |                                    |                               |

### 2.9 Innovation

| Design Requirements   | Responsibility & Implementation | Project Stage                 |
|---|---------------------------------|-------------------------------|
| Construction Waste Management (BESS Innovation 1.1)   |                                 |                               |
| Not less than 90% of all civil works and built form construction waste to be recycled or re-used. | Builder                         | Construction<br>Documentation |

### 3. Implementation of Initiatives

The proposed mixed-use development will meet the BESS, FirstRate5 and MUSIC tool requirements through various initiatives such as the use of low to zero VOC content materials, solar PV, efficient hot water and air-conditioning units and reductions in greenhouse gas emissions through efficient building fabric design.

The initiatives that have been included within this SMP are all initiatives that have a proven track record to serve their individual purpose and can be easily maintained with any failures obvious to the occupants of the units. This helps to ensure the ongoing sustainability of the development as the systems installed in the beginning are maintained for purpose throughout the life of the development.

With appropriate implementation, management, monitoring and maintenance the initiatives outlined within this SMP will serve to provide the residents with lower running costs, and as well as to benefit the environment generally.

BESS, 10-16 Selwyn St, Elsternwick VIC 3185, Australia 10-16 Selwyn St, Elstern...

### **BESS Report**

Built Environment Sustainability Scorecard

This BESS report outlines the sustainable design commitments of the proposed development at 10-16 Selwyn St, Elsternwick VIC 3185, Australia Elsternwick Victoria 3185. The BESS report and accompanying documents and evidence are submitted in response to the requirement for a Sustainable Design Assessment or Sustainability Management Plan at Glen Eira City Council.

Note that where a Sustainability Management Plan is required, the BESS report must be accompanied by a report that further demonstrates the development's potential to achieve the relevant environmental performance outcomes and documents the means by which the performance outcomes can be achieved.

ADVERTISED PLAN

The Built Environment Sustainability Scorecard is an initiative of the Council Alliance for a Sustainable Built Environment (CASBE). For more details see www.bess.net.au

Section Notes; The bike parking calculation based on Clause 52.34 determines the following bike parking spaces are required for each use: - 30 for residents -15 for residential visitors -2 for place of assembly visitors - 7 for shop employees - 8 for shop visitors. The development is providing 8 for shop visitors, 4 for place of assembly, 35 for shop employee located in basement level, 80 for residential uses (including residential visitor) located in basement level. Therefore, the design meets the planning scheme requirement.

### Appendix 2 FirstRate5 Assessment

The FirstRate5 energy rating program is the primary modelling method used in Victoria to indicate the required energy for heating and cooling based on the building's thermal envelope. It does not take into account any heating or cooling systems installed; it only assesses walls, roof and floor materials, insulation, building orientation, glazing and the area layout.

The 10-16 Selwyn Street development is located in Climate Zone 21 (Melbourne) and is required by the 2019 Building Code of Australia (BCA) to achieve a minimum average energy rating of 6-stars for the development with no apartment rating lower than 5-stars. For NCC 2019 heating and cooling load limits are also applied. For the Melbourne climate zone, the maximum individual apartment heating load must not exceed 120MJ/m<sup>2</sup> and cooling load of 62MJ/m<sup>2</sup>. The development also must not exceed an average heating load 88MJ/m<sup>2</sup> and cooling load of 36MJ/m<sup>2</sup>.

Additionally, all apartments should achieve a cooling load not exceeding 30MJ/m<sup>2</sup> per annum.

To facilitate the energy rating assessment, the development has been grouped into 67 thermal groups as shown in the following table:

| Sample Dwelling | Thermally<br>Similar       | Justification  | Star Rating |
|-----------------|----------------------------|--|-------------|
| M01             |                            | Thermally unique                                       | 7.1         |
| M06             | M02, M03,<br>M04, M05      | Similar Orientation, similar layout, and exposed sides | 6.9         |
| M07             |                            | Thermally unique                                       | 6.7         |
| 101             | 201, 301, 401,<br>501      | Similar Orientation, similar layout, and exposed sides | 8.0         |
| 102             | 202, 302                   | Similar Orientation, similar layout, and exposed sides | 7.8         |
| 103             |                            | Thermally unique                                       | 7.1         |
| 104             |                            | Thermally unique                                       | 6.9         |
| 105             |                            | Thermally unique                                       | 7.4         |

### The sample energy ratings have been completed with the following inputs:

| Building Fabric Element                                  | Description   |   |                         |
|--|---|---|-------------------------|
| External Walls   | All the external walls of the apartments will require an additional R2.5 insulation to be added.  |   |                         |
| Party Walls  | Party walls separating neighbouring apartments are assumed as double stud walls with R2.0 insulation added to both studs.   |   |                         |
|  | Party walls between apartments and stair/lift core are assumed as concrete walls with R2.0 acoustic insulation.   |   |                         |
|  | Party walls between apart walls with R2.0 acoustic in   | ments and internal corrido sulation.                    | ors are assumed as stud |
| Internal Walls   | Internal walls within the apartments are assumed as internal stud walls with no insulation added.   |   |                         |
| Ceiling Heights  | Ceiling heights modelled a  | s 2.7m for all apartments.                              |                         |
| Roof Insulation  | All roofs/ceilings have bee   | n modelled as 200mm sus                                 | spended slab.           |
|  | The non-trafficable roof located on Level 2, level 7, level 8 and level 9 have been modelled with additional R4.0 insulation.   |   |                         |
|  | Exposed apartment ceiling<br>will require R2.5 insulation   | g with trafficable balcony<br>n added at ceiling space. | /terraces located above |
| Floor  | Level 2 to Level 9 apartment floors elevated above outdoor air have been modelled with R1.1 underslab insulation added.   |   |                         |
|  | Level 1 apartment floors sitting above the supermarket plant area require<br>R2.3 underslab insulation added to meet the heating load requirement.<br>The remaining apartment floors have been modelled as 200mm thick<br>suspended slab with no insulation required. |   |                         |
|  |   |   |                         |
| Floor Coverings  | Floor coverings have been modelled as tiles for bathrooms / ensuites /<br>laundry and timber for the living room / kitchen and carpet to bedrooms and<br>wardrobe.  |   |                         |
| Windows and Glazing<br><i>Mezzanine Level to Level 8</i> | Window systems are required achieve the following thermal performance values (glass and frame combined):  |   |                         |
| Apartments   |   | U-Value (≤)   | SHGC (±5%)              |
|  | Fixed Windows   | 2.5   | 0.24                    |
|  | Sliding Doors   | 2.9   | 0.22                    |
|  | Awning Window   | 4.3   | 0.20                    |
|  | The above aluminium framed windows are found in Capral Aluminium frames with AGG Max clear glazing.   |   | n Capral Aluminium      |

| Building Fabric Element                   | Description  |                                 |                      |
|---|--|---------------------------------|----------------------|
| Windows and Glazing<br>Level 9 Apartments | Window systems are required achieve the following thermal performance values (glass and frame combined):   |                                 |                      |
|   |  | U-Value (≤)                     | SHGC (±5%)           |
|   | Fixed Windows  | 3.0                             | 0.29                 |
|   | Awning Windows   | 4.6                             | 0.24                 |
|   | Sliding Doors  | 3.4                             | 0.27                 |
|   | The above Aluminium fran<br>EVantage Grey Double Gla   | med windows are found in azing. | n Capral frames with |
| External Shading                          | Eaves overhang and external shading on each level have been modelled as per plans.   |                                 |                      |
| Building Sealing                          | All doors, windows, exhaust fans and openings will be sealed so as to not<br>allow for air infiltration into the units. Exhaust fans assumed in all kitchens,<br>laundry, bathrooms, and ensuites.   |                                 |                      |
| Downlights                                | Downlights must be 'IC' rated (Insulation Contact) to allow for insulation to<br>be placed over the top and be sealed units to prevent air-leakage. Otherwise,<br>downlight covers must be installed to allow for insulation to be placed over<br>the top and no air leakage between habitable room and ceiling. |                                 |                      |

Note: The fabric combinations listed above demonstrate the design has the potential to achieve an average energy rating of 6.8 stars. However, as the building elements may change during the plan refinement process for building approval, the average energy rating is likely to fluctuate. The design team will ensure that, during the building approval stage, the average energy performance rating for the apartments will not fall below 6.5 stars (which is 0.5 star better than the minimum required by NCC 2019).

### Appendix 3 MUSIC Assessment & WSUD Report

#### Objectives

The quality and quantity of stormwater leaving a site can have a significant impact on the surrounding infrastructure and waterways. Impervious surfaces move water quickly and efficiently out of built-up areas straight into stormwater infrastructure, which in turn quickly moves the untreated water into natural watercourses. This process does not treat the stormwater and as the water flows into natural water courses, it causes erosion and pollution of those waterways with the rubbish, sediments, pathogens, and other pollutants off the impervious surfaces into the stormwater drains.

The City of Glen Eira recognises the importance of stormwater management and the effects on the surrounding environment. Part of the SMP includes addressing how the proposed development responds to the principles and requirements of Water Sensitive Urban Design (WSUD). The main objectives for WSUD are:

- To achieve the best practice water quality performance objectives as set out in the Urban Stormwater Best Practice Environmental Management Guidelines, Victoria Stormwater Committee 1999 (as amended). Currently, these water quality performance objectives are:
  - Suspended Solids 80% retention of typical urban annual load;
  - Total Nitrogen 45% retention of typical urban annual load;
  - $\circ$  ~ Total Phosphorus 45% retention of typical urban annual load; and
  - Litter 70% reduction of typical urban annual load.
- To promote the use of water sensitive urban design, including stormwater use.
- To mitigate the detrimental effect of development on downstream waterways, by the application of best practice stormwater management through water sensitive urban design for new developments.
- To minimise peak stormwater flows and stormwater pollutants to improve the health of water bodies, including creeks, rivers and bays.
- To reintegrate urban water into the landscape to facilitate a range of benefits including microclimate cooling, local habitat and provision of attractive spaces for community use and wellbeing.

New developments must also incorporate treatment measures that improve the quality of water and reduce flow of water discharged into waterways and encourage the use of measures to prevent litter being carried off-site in stormwater flows.

#### Site Characteristics

For the purposes of the stormwater assessment, the development has been delineated into the following surface types (Refer Figure 4):

- Total site area (for the purpose of the SMP assessments) 5,700m<sup>2</sup>;
- Non trafficable roof catchment area on level 2, level 7, level 9 and rooftop 2,040m<sup>2</sup> (blue);
- Exposed Landscaped area 1,021m<sup>2</sup> (green); and
- Remaining Impervious Area 2,639m<sup>2</sup> (unshaded area within the site boundary).

### Stormwater Management Initiatives

Stormwater management initiatives will need to be implemented within the development as a means of achieving performance objectives set by the City of Glen Eira (Clause 53.18) and the BESS assessment tool. The following section presents the different surfaces that have been identified for treatment, and the required treatment. The initiatives to manage stormwater flows for the building area will underpin the overall performance of the building and its ability to meet stormwater management objectives.

#### Table 3: List of surface types and their stormwater treatment measures.

| Surfaces   | Topographic<br>Area (m²) | Required Treatment   |
|--|--------------------------|--|
| Non trafficable roof<br>catchment area on level 2,<br>level 7, level 9 and rooftop<br>(blue) | 2,040m²                  | Runoff from the non-trafficable roof area and overflow from the<br>landscaped area will be diverted to 5 x 690mm PSorb cartridge<br>StormFilter system (within 1500mm x 1500mm Pit) before being   |
| Exposed landscaped area<br>(green)   | 1,021m <sup>2</sup>      | diverted to the Legal Point of Discharge (LPD).  |
| Remaining impervious<br>area within site boundary<br>(unshaded)                              | 2,639m²                  | Runoff from all remaining impervious areas will initially be treated<br>by three OceanGuards (200-micron mesh) then diverted to<br>1,500mm x 1,500mm Pit containing 5x690mm PSorb cartridge<br>StormFilter system <sup>4</sup> before being diverted to the Legal Point of<br>Discharge (LPD). |

<sup>&</sup>lt;sup>4</sup> Alternative stormwater treatment devices may be installed provided an equivalent or better stormwater quality outcome is delivered.

#### **StormFilter**

The StormFilter is designed and sized to meet stringent regulatory requirements. It removes the most challenging target pollutants (including fine solids, soluble heavy metals, oil, and soluble nutrients) using a variety of media. During operation, stormwater enters the cartridge chamber, passes through the filtration media and begins filling the cartridge centre tube. When water reaches the top of the cartridge the float valve opens, and filtered water is allowed to drain at the designed flow rate. Simultaneously, a one-way check valve closes activating a siphon that draws stormwater evenly throughout the filter media and into the centre tube. Treated stormwater is then able to discharge out of the system through the underdrain manifold pipework.

Figure 1: StormFilter® components

Figure 2: Example conceptual diagram of a StormFilter® system

#### **OceanGuard**

The OceanGuard technology is a gully pit basket designed to fit within new and existing gully pits to remove pollution from stormwater runoff. The system has a choice of filtration liners, designed to remove gross pollutants, solids, and other attached pollutants as either a standalone technology or as part of a 'treatment train' (e.g. with StormFilter<sup>®</sup>, Jellyfish<sup>®</sup> or biofiltration). OceanGuards are highly effective, easy to install and simple to maintain.

During operation, OceanGuard is designed to intercept stormwater as it enters the stormwater pits throughout a site. The OceanGuard has diversion panels that sit flush with the pit walls, this ensures that as stormwater enters at the top of the pit it is directed to the middle of the insert where the Filtration bag is situated. The filtration bag allows for screening to occur removing 100% of pollutants greater than the opening of the filtration material (200micron, 1600micron bags available). During larger rain events the large flows overflow slots in the flow diverter of the

ADVERTISED

PLAN

OceanGuard ensure that the conveyance of stormwater is not impeded thus eliminating the potential for surface flooding. As the flow subsides, the captured pollutants are held in the OceanGuard filtration bag. The waste then starts to dry which reduces the magnitude of organic material decomposition transitioning between maintenance intervals.

Figure 18: Ocean Protect OceanGuard schematic (Source: Ocean Protect)

#### Stormwater Quality Modelling Results

The preliminary MUSIC model of the treatment measures demonstrates that all minimum pollutant load reductions are met.

Please note that the MUSIC Model has not been undertaken by SDC, but rather by Ocean Protect, and SDC is incorporating this information into this SMP with their permission. All responsibility for the accuracy of the MUSIC model lies solely with Ocean Protect.

Table 4: Pollutant load reduction from the stormwater treatment systems against best practice targets.

| Pollutant Load          | Required Load<br>Reduction | Calculated Load Reduction |
|-------------------------|----------------------------|---------------------------|
| Total Suspended Solids  | 80%                        | 86.9%                     |
| Total Nitrogen          | 45%                        | 70.8%                     |
| Total Phosphorus        | 45%                        | 85.4%                     |
| Gross Pollutants/Litter | 70%                        | 100%                      |

Figure 19: MUSIC interface layout of the stormwater treatment network. All flows will subsequently discharge to the legal point of discharge (LPD) of the site.

#### **MUSIC** Inputs

Listed in the tables below are the basic inputs used for the MUSIC model (version 6.3.0). All low and high-flow bypass volumes were left at MUSIC default (0m<sup>3</sup>/s and 100m<sup>3</sup>/s respectively), unless specified by the manufacturer. *MUSIC Guidelines: Recommended input parameters and modelling approaches for MUSIC users (Melbourne Water 2024)* was used as a guideline in the creation of the model.

Figure 22: 5 x Tall (690) PSorb StormFilters Treatment Node Setup.

#### Rainwater Tank Maintenance

Inspections of roof areas and gutters leading to the tank(s) should take place every 3-6 months. Rainwater in the tank(s) should be checked every 6 months for mosquito infestation. The rainwater tank(s) should be examined every 2 years for sludge build up.

The following key items for inspection have been sourced from City of Port Phillip's "Maintenance Manual - Rainwater Tanks".<sup>5</sup> This has been utilised in the absence of specific guidelines by the City of Glen Eira, and because they are very detailed and appropriate guidelines.

#### LEAF LITTER/DEBRIS IN GUTTERS

Inspect the gutters for presence of litter/debris.

#### BLOCKED DOWNPIPE

Check if water is spilling from the edge of the gutters and ensure that the downpipes are not blocked.

#### FIRST FLUSH DIVERTER CLOGGING

To ensure the diverters function properly, clean out by unscrewing the cap at the base of the diverters and remove the filter. Wash the filter with clean water as well as the flow restrictor inside the cap.

DEBRIS ON THE MESH COVER OVER INLETS/OUTLETS

Ensure that the mesh cover over inlets and outlets are clean of leaves and debris.

DIRT AND DEBRIS AROUND THE TANK BASE OR SIDE

Keep leaf build-up, sticks, and other items off the lid of the rainwater tanks and ensure there is no debris on the base, bottom lip and walls of the tanks.

#### SMELLY WATER OR MOSQUITOS

Ensure that the harvested rainwater does not smell. If there are signs of mosquito infestation, refer to the 'Roof, Gutters, and Rainwater tank' section of this report.

#### PUMP

Ensure the pumps are operating regularly by monitoring the sound. Check that pumps are kept clear of surface water (flooding), vegetation, and have adequate ventilation.

#### MAINS BACKUP OR PUMP OPERATION

If the mains backup switching device fails, it may not be noticed for a long time. Consider a manual operating system to ensure continuous operation.

#### OVERFLOW

Check that the overflow is not blocked and that there is a clear path for water to safely spill from the tank through the overflow pipe when full. Check that a clean mesh screen is safely in place to prevent mosquitoes entering the tank.

#### SEDIMENT/DEBRIS BUILD-UP IN TANK

Inspect the sludge build-up in the bottom of the tank and ensure that it is no more than 20mm thick. When the sludge builds up to be more than 20mm, the rainwater tank can be emptied and washed with a high-pressure washer or hose.

#### BASE AREA

Tanks must be fully supported by a flat and level base. Check for any movement, cracks or damage to the slab or pavers. If damage is observed, empty the tank and have the fault corrected to prevent further damage.

#### MONITORING THE WATER LEVEL

Ensure the monitoring system (be it digital or a simple float system) is functioning properly by checking the water level in the rainwater tanks.

<sup>10-16</sup> SELWYN STREET, ELSTERNWICK | S5111 | SMP.V1

### Roof, Gutters and Rainwater tank

The rainwater will flow through the proposed filtration system before entering the rainwater tank(s). With the leaf blocking system installed, the roof and gutters onsite should be checked, maintained and cleaned annually to avoid blockages from occurring.

Water ponding in gutters should be avoided as this provides a breeding ground for mosquitos; tank(s) should also not become breeding grounds for mosquitoes. If mosquitoes are detected in the tank(s), remedial steps need to occur to prevent breeding.

If mosquitoes or other insects are found in rainwater tanks, the point of entry should be located and repaired. As well as preventing further access, this will prevent the escape of emerging adults. Gutters should be inspected to ensure they do not contain ponded water and be cleaned if necessary.

There is no ideal treatment to kill mosquito larvae present in rainwater. The two commonly recognized treatments involve adding chemicals (medicinal or liquid paraffin, or kerosene) to tanks, which defeats one of the advantages of collecting rainwater. In addition, problems have been reported with both types of treatment.

Tanks can be treated by adding a small quantity of medicinal or liquid paraffin or kerosene. The recommended dose of kerosene is 17mL or one and a quarter tablespoon for an 8,000L tank. When using paraffin, the dose is double that required for kerosene.

Note: Commercial or industrial kerosene, for example power kerosene for tractors etc., **should not** be used in rainwater tanks.

Paraffin can be used in all types of tanks, but there have been reports of coagulation after a time and of deposits forming on the sides of tanks. Kerosene is not suitable for use in tanks coated with Aguaplate<sup>®</sup> and may not be suitable for use in tanks constructed of, or lined with, plastic. If in doubt, consult the manufacturer of the tank. Used carefully, kerosene will not result in risks to human health, but excess quantities can taint the water and very high doses can be poisonous to humans. Kerosene added to the surface will not mix through the body of rainwater in the tank and it will either evaporate or be washed out of the tank by overflow. Kerosene should not be added to tanks when water levels are low.

Internationally, it has been suggested that larvicides, such as temephos, s-methoprene and Bti \*Bacillus thuringiensis), could be used in rainwater tanks (WHO 1997). However, only larvacide s-methoprene is registered for use in rainwater tanks by the Australian Pesticides and Veterinary Medicines Authority.

Note: Vegetable oils should not be used as they can become rancid after a while.<sup>6</sup>

Another option would be adding a very small amount of chlorine (approximately 4 parts per million) to kill off mosquitos and bacteria causing odours. The chlorine will disinfect the water and then evaporate. Chlorine tablets from a pool supplier can be used.

Rainwater tanks should be checked by regular maintenance person every 3-6 months to ensure that connection to the building is maintained and there are no blockages.

Alternatively, onsite tank gauges can help those familiar with the tank know if the tank is not working correctly.

### Ocean Protect Systems Maintenance

Regular maintenance of the OceanGuards and StormFilter system is required to ensure proper ongoing performance. Basic maintenance activities depend on regular visual inspections, which may trigger silt removal or filter replacement, depending on TSS accumulation.

The standard maintenance activities that typically take place as part of an ongoing maintenance schedule for the OceanGuards are detailed below. For additional information relating to the maintenance of the OceanGuard filters refer to the OceanGuard Operations and Maintenance Manual.

| Activity         | Frequency   | Maintenance Detail  | Cleanout Procedures   |
|------------------|---|---|---|
| Minor<br>Service | 1-6 times annually  | <ul> <li>Filter bag inspection and evaluation</li> <li>Removal of capture pollutants</li> <li>Disposal of material</li> </ul> | This service is designed to return the<br>OceanGuard® back to optimal operating<br>performance. This type of service can be<br>undertaken either by hand or with the<br>assistance of a Vacuum unit. Cleanour<br>Procedures as follows:<br>1, Establish a safe working area around the<br>OceanGuard<br>2, Remove access cover/grate<br>3, Use two lifting hooks to remove the<br>filtration bag<br>4, Empty the contents of the filtration bag<br>into a disposal container<br>5, Inspect and evaluate the filtration bag<br>6, Inspect and evaluate remaining<br>OceanGuard® components (i.e. flow<br>diverter, filtration cage and supporting<br>frame)<br>7, Rejuvenate filtration bag by removing<br>pollutant build up with a stiff brush,<br>additionally the filtration bag and replace<br>access cover/grate |
| Major<br>Service | As required<br>(dictated by<br>assessment during<br>minor services) | <ul><li>Filter bag replacement</li><li>Support frame rectification</li></ul>  | Replace the filtration bag if filtration bag<br>inspection reveals damage.<br>Perform rectification works and if<br>necessary, replace component when<br>component inspection reveals damage.   |

| Extreme Events           | Remediation/ Maintenance Requirements  |
|--------------------------|--|
| Hazardous Material Spill | If there is a spill event on site, all OceanGuard <sup>®</sup> pits that potentially received flow should be inspected and cleaned. Specifically, all captured pollutants from within the filtration bag should be removed and disposed in accordance with any additional requirements that may relate to the type of spill event. All filtration bags should be rejuvenated (replaced if required) and re-installed.  |
| Blockages                | The OceanGuard's internal high flow bypass functionality is designed to minimise the potential of blockages/flooding and this configuration has been field proven for over twenty years. Flooding caused by an OceanGuard style of pit basket is extremely rare and in the unlikely event that flooding occurs around the stormwater pit the following steps should be undertaken to assist in diagnosing the issue and implementing the appropriate response.<br>1. Inspect the OceanGuard® flow diverter, ensuring that they are free of debris and pollutants |

| Extreme Events               | Remediation/ Maintenance Requirements  |
|------------------------------|--|
|                              | 2. Perform a minor service on the OceanGuard   |
|                              | pipes, ensuring they are free of debris and pollutants   |
| Major Storms and<br>Flooding | In addition to the scheduled activities, it is important to inspect the condition of the OceanGuard <sup>®</sup> after a major storm event. The inspection should focus on checking for damage and higher than normal sediment accumulation that may result from localised erosion. Where necessary damaged components should be replaced and accumulated pollutants disposed. |

The standard maintenance activities that typically take place as part of an ongoing maintenance schedule for the Ocean Protect StormFilter System are detailed below. Note that as the StormFilter cartridges capture pollutants the media will eventually become occluded and require replacement (expected media life is 1-3 years). For additional information relating to the maintenance of the StormFilter System refer to the StormFilter Operations and Maintenance Manual.

| Activity         | Frequency       | Maintenance Detail   | Cleanout Procedures   |
|------------------|-----------------|--|---|
| Inspection       | Every 6 Months  | <ul> <li>Visual Inspection of<br/>cartridges &amp; chamber</li> <li>Remove larger gross<br/>pollutants</li> <li>Perform minimal<br/>rectification works (if<br/>required)</li> </ul> | The purpose of the inspecting the<br>StormFilter system is to assess the<br>condition of the StormFilter chamber and<br>cartridges. When inspecting the chamber,<br>particular attention should be taken to<br>ensure all cartridges are firmly connected<br>to the connectors. It is also an optimal<br>opportunity to remove larger gross<br>pollutants and inspect the outlet side of<br>the StormFilter weir.   |
| Minor<br>Service | Every 12 Months | <ul> <li>Evaluation of cartridges and media</li> <li>Removal of accumulated sediment (if required)</li> <li>Wash-down of StormFilter<sup>®</sup> chamber (if required)</li> </ul>    | This minor service is designed to ensure<br>the ongoing operational effectiveness of<br>the StormFilter® system, whilst assessing<br>the condition of the cartridge media.<br>Cleanout procedure as follows:<br>1. Establish a safe working area around the<br>access point(s)<br>2. Remove access cover(s)<br>3. Evaluate StormFilter® cartridge media (if<br>exhausted schedule major service within 6<br>months)<br>4. Measure and record the level of<br>accumulated sediment in the chamber (if<br>sediment depth is less than 100 mm skip<br>to step 9)<br>5, Remove StormFilter® cartridges from<br>the chamber<br>6. Use vacuum unit to removed<br>accumulated sediment and pollutants in<br>the chamber<br>7. Use high pressure water to clean<br>StormFilter chamber<br>8. Re-install StormFilter® cartridges<br>9- Replace access cover(s) |

| Activity         | Frequency  | Maintenance Detail                                  | Cleanout Procedures   |
|------------------|--|---|---|
| Major<br>Service | As required<br>(dictated by<br>assessment during<br>minor services). | • Replacement of<br>StormFilter® cartridge<br>media | This service is designed to return the<br>StormFilter device back to optimal<br>operating performance. Cleanout<br>procedure as follows:<br>1, Establish a safe working area around the<br>access point(s)<br>2. Remove access cover(s)<br>3' By first removing the head cap, remove<br>each individual cartridge hood to allow<br>access to the exhausted media<br>4. Utilise a vacuum unit to remove<br>exhausted media from each cartridge<br>5. Use vacuum unit to remove<br>accumulated sediment and pollutants in<br>the chamber<br>6. Use high pressure water to clean<br>StormFilter chamber<br>7. Inspect each empty StormFilter®<br>cartridges for any damage, rectify damage<br>as required<br>8. Re-fill each cartridge with media in line<br>with project specifications<br>9. Re-install replenished StormFilter®<br>cartridges<br>10.Replace access cover(s) |

| Extreme Events               | Remediation/ Maintenance Requirements  |
|------------------------------|--|
| Hazardous Material Spill     | If there is a spill event on site, the StormFilter unit should be inspected and cleaned.<br>Specifically, all captured pollutants and liquids from within the unit should be removed<br>and disposed in accordance with any additional requirements that may relate to the<br>type of spill event. Additionally, it will be necessary to inspect the filter cartridges and<br>assess them for contamination – and, depending on the type of spill event, it may be<br>necessary to replace the filtration media. |
|                              | In the unlikely event that flooding occurs upstream of the StormFilter <sup>®</sup> system, the following steps should be undertaken to assist in diagnosing the issue and determining the appropriate response.   |
| Blockages                    | 1. Inspect the upstream diversion structure (if applicable) ensuring that it is free of debris and pollutants  |
|                              | 2. Inspect the StormFilter <sup>®</sup> unit checking the underdrain manifold as well as both the inlet and outlet pipes for obstructions (e.g. pollutant build-up, blockage), which if present, should be removed   |
| Major Storms and<br>Flooding | In addition to the scheduled activities, it is important to inspect the condition of the StormFilter <sup>®</sup> after a major storm event. The focus is to inspect for damage and abnormally high sediment accumulation that may result from localised erosion. Where necessary damaged components should be replaced and accumulated pollutants should be removed and disposed.   |

### Stormwater Runoff Treatment during the Construction Stage

The below construction stage stormwater management solutions are potential treatment options which may be incorporated into the site during construction. The building contractor will provide a detailed stormwater management plan for the site during construction and demolition at a later date.

 Gravel Sausage filters – to be placed at the entrance of pits/side stormwater inlets. These permeable sacks will filter the suspended soils and sediments and any other litter carried by the stormwater to prevent the pollutants entering the system

 Silt Fences Under Grates - Silt fence material may be placed under the grate of surfaceentry inlets to prevent sediment from entering the stormwater system.

### Appendix 4 VOC and Formaldehyde Emissions Limits

 Table 5: Maximum Volatile Organic Compound Levels for construction materials (Source: Green Building Council Australia –

 Green Star Buildings Submission Guidelines Version 1, 2021)

| Product Type/Subcategory  | Max TVOC Content (g/L of ready-to-use-product) |
|---|--|
| Paints, Varnishes and Protective Coatings                                 |  |
| Walls and ceilings – interior semi-gloss                                  | 16   |
| Walls and ceilings – interior low sheen                                   | 16   |
| Walls and ceilings – interior flat washable                               | 16   |
| Ceilings – interior flat  | 14   |
| Trim – gloss, semi-gloss, satin, varnishes, and wood stains               | 75   |
| Timber and binding parameters   | 30   |
| Latex primer for galvanised iron and zincalume                            | 60   |
| Interior latex undercoat  | 65   |
| Interior sealer   | 65   |
| One and Two pack performance coatings for floors                          | 140  |
| Any solvent-based coatings whose purpose is not covered in table          | 200  |
| Adhesives and Sealants  |  |
| Indoor carpet adhesive  | 50   |
| Carpet pad adhesive   | 50   |
| Wood flooring and laminate adhesive                                       | 100  |
| Rubber flooring adhesive  | 60   |
| Sub-floor adhesive  | 50   |
| Ceramic tile adhesive   | 65   |
| Cove base adhesive  | 50   |
| Dry wall and panel adhesive   | 50   |
| Multipurpose construction adhesive (includes fire/waterproofing sealants) | 70   |
| Structural glazing adhesive   | 100  |
| Architectural sealants  | 250  |
| Carpets   |  |
| Total VOC limit   | 0.5mg/m² per hour                              |
| 4-PC (4-Phenylcyclohexene)  | 0.05mg/m <sup>2</sup> per hour                 |

### Appendix 5 BESS Daylight Assessment

#### **Residential**

All apartments have been assessed for their expected daylight amenity, using the BESS best-practice simple daylight assessment methodology. Living rooms and bedrooms are considered to achieve best-practice daylight amenity when they have the following characteristics:

- Rooms are within 8m of a window (or 5m if south facing)
- Floor-to-ceiling height of at least 2.7m
- Glazing to have a VLT of at least 60%
- There are no major obstructions in front of the window
- The rooms comply with the BESS building separation tables.

79% (117/148) of the living areas and 84% (246/292) of the bedrooms across the development have the above characteristics.

For those bedrooms and living rooms that do not meet the auto-pass requirement, SDC has completed the daylight assessment by measuring the horizontal and vertical daylight access angles, room area, and window area for each bedroom and living room.

The final daylight assessment results indicate that 80% of the living rooms within the development meet a 1% daylight factor, while 94% of the bedrooms within the development meet a 0.5% daylight factor. Refer to the figures below for markup indicating the room depth of the bedroom(s) and living area in each apartment, non-autopass living rooms (pink), non-autopass bedrooms (red), and the horizontal/vertical daylight access angles for each room.

Figure 24: First Level Daylight Assessment Markup.

Figure 25: Second Level Daylight Assessment Markup.

Figure 26: Third Level Daylight Assessment Markup.

Figure 32: Level 9 Daylight Assessment Markup.

Figure 33: East Elevation Vertical Angle - Daylight Assessment Markup.

W WEST ELEVATION

Figure 34: West Elevation Vertical Angle - Daylight Assessment Markup.

#### Non-Residential

The following Green Star hand calculations are provided to demonstrate that the proposed non-residential components of the development offer adequate daylight amenity. The daylight mark-ups are included for reference.

Note that the supermarket has been excluded from this assessment, as external daylight is not suitable for such facilities due to potential issues with radiant heat affecting food storage. However, other non-residential areas, including shops/food and drink premises, offices, and assembly areas, have been assessed. Unoccupied spaces, such as back-of-house and storage areas, have not been included in the assessment.

The areas shaded in orange in the markup indicate those parts of the nominated floor space expected to achieve a Daylight Factor of 2% or higher, while the yellow-shaded areas denote those that do not comply. The Green Star Daylight Hand Calculation methodology was utilised to evaluate light penetration through glazing, with the goal of ensuring that at least 33% of the floor area in all non-residential spaces meets the compliance standards.
