1. Introduction

1.1 Background

Barwon Water (BW) has engaged GHD Pty Ltd to prepare a Development Licence Application (DLA) for its proposed Regional Renewable Organics Network (RRON). This waste management assessment report has been prepared to support the DLA.

The RRON will be located at BW's Black Rock Water Reclamation Plant (WRP) located at 405 Blackrock Road, Connewarre, approximately 18 km south of Geelong. The Black Rock WRP is an established organic waste recycling facility that treats wastewater and produces Class A and Class C recycled water, as well as processing approximately 60,000 tonnes/year (t/y) of biosolids.

The RRON facility is proposed to process approximately 40,000 t/y of comingled food organics and garden organic (FOGO) waste predominately from local Municipalities. This FOGO stream will be pre-processed and separated to produce a food organics (FO) rich stream and a garden organics (GO) rich stream. The facility will also process other feedstocks including bulk green waste (~9,000 t/y), commercial and industrial (C&I) organic waste (~2,000 t/y), and biosolids (from BW's WRPs). The main processes proposed for the RRON include:

- Thermal processing via carbonisation of the GO-rich stream (separated from FOGO), bulk green waste and biosolids
- Plug flow anaerobic digestion (PFAD) of the FO-rich stream (separated from FOGO) and FO-rich C&I organic waste.

The RRON will produce the following product streams:

- Biochar (from carbonisation), a high-value product for agriculture and production of advanced sustainable materials.
- Syngas (from carbonisation), which will be used within the RRON facility to dry the carbonisation feedstocks down to a suitable moisture content for carbonisation
- Digestate (from the PFAD), a product containing high levels of nutrients, which is beneficial in agricultural applications
- Biogas (from the PFAD), which will be transferred to the neighbouring Biosolids Drying Facility and converted into heat via a biogas boiler, reducing the demand for natural gas

Further information on the environmental setting of the RRON facility and a detailed process description are provided in the DLA report. This report should be read in conjunction with the DLA report.

1.2 Purpose

The purpose of this report is to outline the proposed feedstocks that the RRON facility will process and describe the wastes generated by the proposed development activity in accordance with the Environment Protection Act 2017 (EP Act 2017) and Environment Protection Regulations 2021 (EP Regulations 2021). This report is intended to be used to support the DLA.

1.3 Scope of works

The scope of works completed for the waste management assessment report is as follows:

- Outline the waste feedstock including waste types, volumes and characteristics/properties that the RRON facility will process
- Investigate and document the waste duties under the EP Act 2017 and EP Regulations 2021 in managing the main waste processing residues generated by the proposed development activity
- Describe and classify the main wastes generated by the proposed development activity in accordance with the EP Act 2017 and EP Regulations 2021 and associated guidelines

- Identify management options in accordance with the Waste Management Hierarchy for the main waste processing residues generated by the proposed development activity
- Broadly identify management systems and processes required to handle, transport off-site (if required), process and treat the main waste processing residues generated by the proposed development activity in order to demonstrate BW's general environmental duty (GED) in the management of waste

1.4 Limitations

This report has been prepared by GHD for Barwon Water and may only be used and relied on by Barwon Water for the purpose agreed between GHD and Barwon Water as set out in Section 1.1 of this report.

GHD otherwise disclaims responsibility to any person other than Barwon Water arising in connection with this report. GHD also excludes implied warranties and conditions, to the extent legally permissible.

The services undertaken by GHD in connection with preparing this report were limited to those specifically detailed in the report and are subject to the scope limitations set out in the report.

The opinions, conclusions and any recommendations in this report are based on conditions encountered and information reviewed at the date of preparation of the report. GHD has no responsibility or obligation to update this report to account for events or changes occurring subsequent to the date that the report was prepared.

The opinions, conclusions and any recommendations in this report are based on assumptions made by GHD described in this report. GHD disclaims liability arising from any of the assumptions being incorrect.

GHD has prepared this report based on information provided by BW and others who provided information to GHD (including Government authorities), which GHD has not independently verified or checked beyond the agreed scope of work. GHD does not accept liability in connection with such unverified information, including errors and omissions in the report which were caused by errors or omissions in that information.

2. Feedstock basis

2.1 Feedstock sources, types, and combinations

Organic feedstock for the RRON will be obtained from a combination of sources, namely:

- The vast majority expected is FOGO from the following four local councils with waste supply agreements (WSAs) in place with Barwon Water:
 - Borough of Queenscliffe
 - City of Greater Geelong
 - Golden Plains Shire Council
 - Surf Coast Shire Council
- Bulk green waste from the local councils listed above and from local composting facilities
- Commercial and industrial (C&I) organic waste to be supplied from local businesses, factories, and other commercial operations
- Dewatered waste activated sludge (WAS) from Barwon Water's existing Water Reclamation Plants (WRP)
- Bioprill (thermally dried WAS) from the Black Rock Biosolids Drying Facility

Accordingly, the feedstock profile to the facility has been broken down as follows:

- Council waste received as part of a FOGO collection, comprising:
 - Food organic (FO) waste, including materials such as vegetable peelings, meat offcuts and general leftovers from household kitchens
 - Household garden organic (GO) waste, including materials such as small branches, wood chips, lawn clippings and other garden materials disposed of at a household level
- C&I waste, including materials such as brewery waste, paunch waste and offal from abattoirs, and dissolved air floatation (DAF) sludge from industrial wastewater treatment
- WRP sludge (dewatered WAS) from one or more of Barwon Waters WRP's and bioprill (thermally dried WAS) from the Black Rock Biosolids Drying Facility

2.2 Feedstock quantities

2.2.1 Council waste projections

The expected quantities for the council FOGO to be processed via the PFAD for Year 1 and Year 8 of operation is provided in Table 1.

Table 1 *Expected FOGO composition from council waste collection*

Waste Source	Year 1 Quantity (wet t/y)	Year 1 Annual average (%)	Year 8 Quantity (wet t/y)	Year 8 Annual Average (%)
Council waste composition				
Food organics (FO)	~8,300	20%	~8,900	18%
Garden organics (GO)	~30,900	76%	~38,800	78%
Impurities / contamination	~1,700	4% ⁽¹⁾	~1,900	4% ⁽¹⁾
Totals	~40,900	-	~49,600	-
Note (1): based on an estimate from the RRON Design Contractor. Impurities / contamination levels are likely to reduce overtime as noted in section 2.2.3.				

2.2.1.1 Seasonal variability

The RRON facility will be designed to consider seasonal variability in council waste quantities as presented in Figure 1 for the 2034/35 year.

The data presented in Figure 1 shows the indicative seasonal variability in GO collection quantities from the relevant councils. It has been assumed that there is negligible variability in FO quantities through the year. As shown in Figure 1, the peaking factor varies throughout the year with a minimum in winter and a maximum in spring. The peaking factor has been calculated as the ratio of the monthly quantity of FOGO to the annual average based on the annual totals shown in Table 1 above. 90th percentile (%ile) monthly FOGO quantities were also estimated based on the council data with the 90th %ile monthly peaking factor indicated on the charts with a cross.

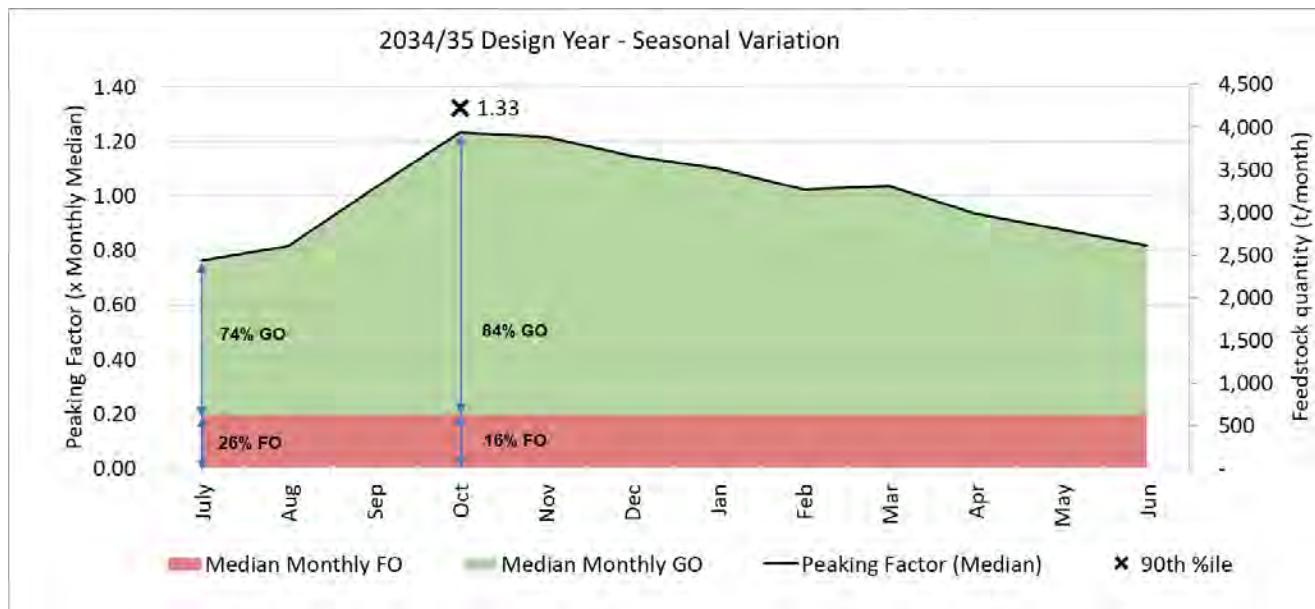

Figure 1 Projected seasonal variation in council FOGO

2.2.2 C&I waste projections

C&I waste sources and quantities are expected to vary throughout the operating life of the RRON facility due to variations and additions to Barwon Water's WSAs with industry partners, which are yet to be established. Initial investigations into potential waste sources and quantities have been undertaken with a summary provided in Table 2.

The facility shall be able to accept and process the C&I feedstock types presented in Table 2. Presently it is estimated that the RRON will process approximately 2,000 tonnes per annum of C&I waste in year 1 and potentially up to 6,5000 tonnes per annum in years 8-25.

Barwon Water may also consider accepting and processing other waste in the future (e.g., animal processing wastes), however, it is acknowledged that introducing this waste could have implications for waste classification of the digestate from the PFAD (refer discussion in section 4.4.1).

Table 2 Potential commercial and industrial (C&I) waste sources

Waste type	Potential quantities (wet t/y)
Wastes from malt industry	2,580
Wastes from brewing industry (malt, spent grain, hops)	2,590
Aggregated liquid waste grease trap cleanouts	1,300

2.2.3 Contamination

Based on prior audits of FOGO undertaken by RRON councils and others (Rawtec for NSW FOGO bins)¹, it is expected that physical contaminants will make up between 1-2% of FOGO material by mass over the longer term. However, it should be noted that as of July 2024 only two of the four participating council areas have commenced FOGO collection services, and higher contamination rates (indicative range of 3-7%) are possible, particularly in the first 12 to 24 months of FOGO service implementation for the remaining two councils as householders adapt to the new waste collection procedures and protocols once implemented.

The main council waste contaminant types are expected to fall into the following categories:

- Plastics
- Containerised food (e.g., glass and plastic containers and the food they contained)
- Metals (ferrous & non-ferrous)
- All other organics (leather, rubber, and oils)
- Bulk materials not suitable for subsequent shredding and digestion (e.g., bricks, copper, chrome, arsenic (CCA) treated timber, rocks/soil, construction materials)
- Other miscellaneous (e.g., bagged materials, bulky household goods)

Hitachi Zosen Inova (HZI) Australia is the Principal Contractor for the early contractor involvement (ECI) design of the RRON facility. Based on the mass balance for the RRON facility developed by HZI as part of the ECI design, the total quantity of contaminated feedstock material removed as part of the feedstock pre-processing is approximately 4% of the waste feedstocks. A description on the pre-treatment processes for removal of the contamination from the feedstocks is included in section 5.2.

2.3 Carbonisation feedstocks

The carbonisation plant will receive feedstock from the following sources:

- Garden organics material separated from the council FOGO stream
- Bulk green waste from local council transfer stations and local organic facilities
- Biosolids from the Barwon Water WRPs
- Bioprill from the Black Rock Biosolids Drying Facility

2.3.1 Council garden organics

Garden organics material in the council FOGO stream that is suitable for processing via carbonisation will be separated during pre-treatment processing. It is estimated this will consist of around 6,000 tonnes per annum in year 1, increasing to 12,000 tonnes per annum from Year 8 onwards.

2.3.2 Bulk green waste

Composting facilities receive garden organic material such as logs or branches that do not fully decompose through composting processes. This type of material is called overs. Overs materials is often disposed to landfill at significant cost. Consultation with local composting facilities by Barwon Water has indicated that they have a supply of overs that could form part of the carbonisation feedstock for the RRON. It is estimated that overs material processed via carbonisation will be approximately 4,000 tonne per annum.

Additionally, bulk green waste taken by community members to council transfer stations also presents a disposal challenge for councils with the it generally being disposed to landfill. Similar to the overs material the bulk green waste from council transfer stations can be processed via carbonisation. It is estimated that 5,000 tonnes per annum of bulk green waste could be processed at RRON.

¹ Rawtec 2018. *Analysis of NSW Food and Garden Bin Audit Data*, May 2018

2.3.3 WRP sludge and bioprill

The carbonisation facility will process WRP sludge from BW's regional WRP facilities and the Black Rock WRP. It is expected that in the first 7 years of the RRON approximately 10,000 t/y of sludge from regional WRP's and approximately 7,900 t/y of bioprill will be processed via carbonisation. Bioprill is the thermally dried biosolids sourced from the Black Rock Biosolids Drying Facility. Following closure of the Biosolids Drying Facility in around 2032 the RRON is expected to process approximately 36,000 t/y of WRP sludge, which will be sourced from the Black Rock WRP and BW's other regional WRPs.

The WRP sludge to be processed at the facility will be delivered from BW's regional WRP facilities, via trucks with relevant EPA permissions. Currently regional WRP sludge is delivered to the Biosolids Drying Facility which is also located at Black Rock WRP. The estimated payload per truck is 20 tonnes. The regional WRP facilities include:

- Apollo Bay WRP
- Anglesea WRP
- Colac WRP
- Lorne WRP

Chemical testing

Laboratory analysis of the WRP sludge from Apollo Bay, Anglesea, Colac, Lorne and Black Rock WRPs is included in Appendix A. Laboratory analysis of the bioprill from the Black Rock Biosolids Drying Facility is also included in Appendix A. A summary of concentrations of analytes is included in Table 3.

Testing for perfluoroalkyl and polyfluoroalkyl substances (PFAS) is provided for all WRPs and testing for heavy metals is presented for the Colac WRP. Heavy metal concentrations at the Apollo Bay, Anglesea and Lorne WRPs are expected to be consistent with the Colac WRP concentrations. The analysis was undertaken by NATA accredited laboratory ALS Environmental predominately in 2022 and the chemical concentrations are expected to be consistent with current concentrations in the WRP sludge. Analysis of the perfluoroalkyl and polyfluoroalkyl substances (PFAS) was undertaken in 2024 by ALS Environmental.

WRP sludge is classified as a reportable priority waste under waste code K400-H (refer to Table 5 for further information).

Table 3 WRP sludge and bioprill contaminant concentrations

WRP	Analyte	Concentration (mg/kg)
Apollo Bay	Oil and grease	1,800 to 5,000
	pH	4.8 to 6.6
	PFOA	<0.0025 – 0.013
	PFOS	0.0075 – 0.039
	PFHxS	<0.0025
Anglesea	Oil and grease	5,600 to 16,000
	pH	6.4 to 6.8
	PFOA	<0.0025 – 0.0029
	PFOS	0.0049 – 0.014
	PFHxS	<0.0025
Colac	Aluminium	22,000
	Antimony	<5
	Arsenic	<5
	Barium	94
	Beryllium	<5
	Boron	17

WRP	Analyte	Concentration (mg/kg)
	Cadmium	0.3
	Chromium (total)	16
	Copper	110
	Lead	7
	Mercury	0.09
	Molybdenum	5
	Nickel	14
	Selenium	<3
	Silver	<5
	Vanadium	7
	Zinc	340
	Oil and grease	4,700 to 19,000
	pH	5.9 to 6.8
	PFOA	<0.0025
	PFOS	<0.0025 – 0.014
	PFHxS	<0.0025
Lorne	Oil and grease	2,600 to 8,200
	pH	5.7 to 6.9
	PFOA	<0.0025 – 0.018
	PFOS	0.0069 – 0.018
	PFHxS	<0.0025
Black Rock (WRP sludge)	PFOA	<0.0025
	PFOS	0.0053 – 0.022
	PFHxS	<0.0025
Black Rock (bioprill)	PFOA	<0.0025
	PFOS	0053 – 0.013
	PFHxS	<0.0025
	pH	5.98
	Aluminium	6,747
	Arsenic	14
	Boron	59
	Cadmium	0.7
	Chromium (total)	52
	Copper	331
	Lead	10
	Mercury	0.6
	Molybdenum	5.12
	Nickel	18
	Selenium	6.2
	Silver	2.3
	Zinc	549

2.4 Feedstock summary

Table 4 summarises the expected feedstocks to be processed by the RRON facility. Based on upper limit quantity projections for council and C&I waste in Year 8 an annual throughput of around 87,600 t/y is expected for the RRON facility.

Table 4 Summary of expected feedstock quantities

Waste source	Quantity, Year 1 (wet t/y)	Quantity, Year 8 (wet t/y)
FOGO	~40,900	~49,600
C&I waste	~2,000	~2,000
Bulk green waste	~9,000	-
WRP sludge	~10,000	~36,000
Bioprhil	~7,900	-
Total	~69,800	~87,600

3. Waste types and classification

3.1 Wastes received and generated

Table 5 summarises the wastes including priority waste and reportable priority waste (RPW) to be received at the RRON facility and the waste classification in accordance with the EP Regulations 2021.

Table 6 summarises the wastes including priority waste and RPW to be generated by the RRON facility and the waste classification in accordance with the EP Regulations 2021.

Table 5 Wastes received at the RRON facility

Waste types	Description	Indicative quantities Year 1 (t/y)	Indicative quantities Year 8 (t/y)	Waste code	Pre-classified (Pre) or Mirror code (M)	Priority waste	Reportable priority waste (transactions)	Reportable priority waste (transport)
FOGO	Council food and garden organics and commercial garden & landscaping organics	40,900	49,600	K300 (commercial streams)	Pre	No	No	No
Garden organics	Bulk garden organics material from transfer stations and composting facilities	9,000	-	K300 (commercial streams)	Pre	No	No	No
Treated sewage solids and sludge	Barwon Water WRP sludge	10,000	36,000	K400-H	Pre	Yes	Yes	Yes
Treated sewage solids and sludge (bioprill)	Black Rock thermally dried biosolids known as bioprill	7,900	-	K400-NH	Pre	Yes	No	No
Aggregated liquid waste grease trap cleanouts	Grease trap waste	Up to 1,300	Up to 1,300	K110	Pre	Yes	Yes	Yes
Malt byproduct waste	Solid and liquid wastes from malt processing industry	Up to 2,000	Up to 2,580	K200 and K210	Pre	No	No	No
Malt waste, spent grain, hops waste	Byproduct of brewing industry (food waste)	Up to 2,000	Up to 2,950	K210	Pre	No	No	No

Table 6 Wastes generated at the RRON

Waste type	Description	Indicative quantities Year 1	Indicative quantities Year 8	Waste code	Pre-classified (Pre) or Mirror code (M)	Priority waste	Reportable priority waste (transactions)	Reportable priority waste (transport)
Biochar	Biochar from the carbonisation of feedstocks described in section 2.3	5,070 - 6,700 t/y	4,800 - 6,355 t/y	N205	Pre	Yes	Yes	Yes
Solid digestate	Solid digestate from the PFAD (post-aeration)	24,000 t/y	25,600 t/y	N205	Pre	Yes	Yes	Yes
Liquid digestate	Liquid digestate from the PFAD	5,450 t/y	6,850 tonnes/y	N205	Pre	Yes	Yes	Yes
Fly ash	Ash from carbonisation plant flue ducts	24 m ³ /y	24 m ³ /y	N150	Pre	Yes	Yes	Yes
Scrubber effluent	Process water (effluent) stream that can be reused as an ammonium sulphate liquid fertiliser product	27,400 m ³ /y	27,400 m ³ /y	L200-H	M	Yes	Yes	Yes
Pre-treatment wastes (inc. metals, plastics, paper/cardboard, etc)	Metals, plastics and paper/cardboard removed during pre-treatment	1,750 t/y	1,880 t/y	Z300, Z310, Z400, Z500	Pre	No	No	No

4. Waste hierarchy

The waste management hierarchy is one of the Principles of Environment Protection of the Environment Protection Act (EP Act) 2017. As per Section 18 of the EP Act, waste should be managed in accordance with the following order of preference, so far as reasonably practicable - (a) avoidance; (b) reuse; (c) recycling; (d) recovery of energy; (e) containment; (f) waste disposal (as shown in Figure 2).

The RRON facility will be diverting food organics and some garden organics that have been historically disposed of to landfill. In addition, the facility will be producing biochar, a high-value product for agriculture and production of advanced sustainable materials.

Discussion of waste avoidance and minimisation and the specific wastes generated by the RRON facility and their management pathways is included in the below sections.

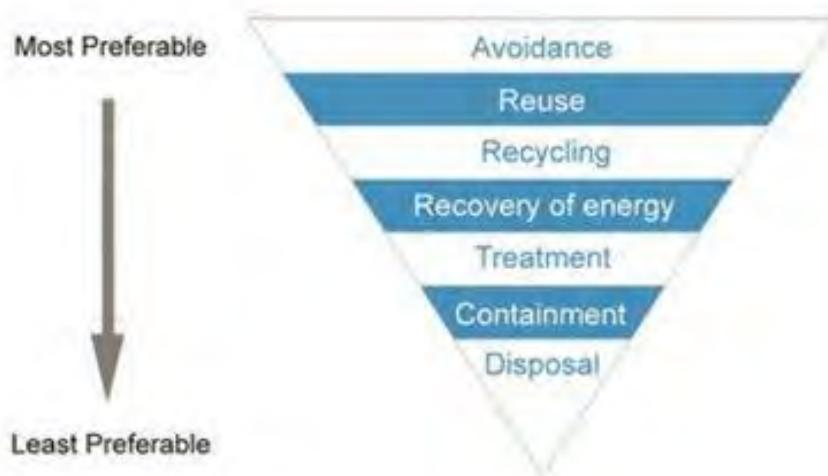

Figure 2 *Waste management hierarchy*

4.1 Waste avoidance

Waste avoidance is based on preventing the generation of waste at the source. In addition to providing a regional solution for organic waste management, the RRON will seek to encourage individuals, businesses, and industries to make choices that result in reduced waste production. This will be achieved via Community Education Programs, which the operational facility will provide a platform for. This will include workshops, seminars, and public presentations to educate the local community about the anaerobic digestion process, the importance of recycling, contamination and the benefits of waste avoidance in the context of the waste management hierarchy. Council's supplying FOGO to the RRON have also committed to collaborate on the community education.

It is envisaged that facility tours will allow community members to see the operation firsthand will be undertaken. This also provides information on the positive environmental impact of the facility, including reduced landfill waste, reduced greenhouse gas emissions, and the production of renewable energy which will assist the community in understanding the importance of placing the correct waste material in FOGO bins.

4.2 Waste minimisation

Waste minimisation is focused on reducing the volume of waste generated. Consistent with the community education outlined above, BW in collaboration with the Council's providing the FOGO, will seek to educate the broader community to prevent contamination in their food waste and how this can benefit an anaerobic digestion operation in several ways, ultimately resulting in less waste generated at the site. HZI Australia has documented the following benefits of reduction in FOGO contamination:

- **Improved Feedstock Quality:** When the community is educated about separating food waste from contaminants like plastics and non-organic materials, anaerobic digestion facilities receive a higher quality feedstock. This improves the efficiency and effectiveness of the anaerobic digestion process.
- **Reduced Processing Costs:** Contamination in food waste can increase the cost of pre-processing and sorting before digestion. Educating the public to reduce contamination lessens the need for these procedures, saving money for the facility.
- **Enhanced Anaerobic Digestion Efficiency:** Clean food waste ensures that the anaerobic digestion system operates at optimal conditions, leading to increased biogas production and organic matter conversion rates. This leads to more energy generation from the same feedstock.
- **Lower Maintenance and Equipment Wear:** Contaminants in food waste can cause damage to equipment in anaerobic digestion operations. Reducing contamination leads to reduced maintenance costs and extends the lifespan of the equipment.
- **Minimized Waste Residue:** Contamination results in the production of contamination residual material that must be disposed off-site. Educating the public to reduce contamination can lead to a decrease in the amount of residue produced, simplifying waste management.
- **Enhanced Environmental Performance:** Reduced contamination in the feedstock results in fewer non-organic materials being processed. This minimizes the environmental impact of disposal or recycling of materials that should not have entered the anaerobic digestion process.
- **Extended System Longevity:** The longevity and reliability of anaerobic digestion facilities are enhanced when they operate with cleaner feedstock. Educating the community about contamination prevention contributes to the long-term sustainability of these operations.
- **Increased Community Engagement:** Community education on proper food waste separation fosters greater community involvement and support for anaerobic digestion facilities. It can lead to better relationships between the facility and local residents.

HZI Australia has advised that the following materials that should not typically go into the anaerobic digestion process:

- Non-Organic Materials such as plastics, glass, metal, and other inorganic materials
- Hazardous Waste including chemicals, toxic substances, and heavy metals
- Stones and Gravel
- Sanitary Products, such as nappies and sanitary pads
- Medications and Pharmaceuticals
- Pet Waste, due to the potential presence of pathogens and contaminants
- Large Bones
- Food Packaging, such as plastic bags, aluminium foil, and styrofoam

4.3 Waste management pathways

4.3.1 Pre-treatment wastes

The pre-treatment sorting equipment (refer section 5.2) will remove contamination in the FOGO feedstock. The expected contamination in the feedstock is described in section 2.2.3. Ferrous and non-ferrous metals removed will be sent to a metal recycler which is authorised to receive the metal waste. Other residual paper/cardboard, plastic and textile wastes will be disposed of, or recycled where possible to facilities licensed to accept the waste (such as a landfill, energy from waste facility or a suitable recycling facility). Metals are more likely to be recycled compared to plastics or cardboard, which are often more challenging due to contamination.

Some contaminated items can also be repurposed for educational purposes in a community education centre. Using these items as visual aids during workshops, presentations, or hands-on activities focused on waste management, recycling can be used to explain why these items should not be placed in food waste bins.

It is estimated in year 1 of the RRON operation that 1,750 tonnes of impurities (such as metals, plastic, textiles, etc) will be separated via the pre-treatment sorting equipment.

4.3.2 Liquid digestate

A screw press will separate digestate into liquid digestate and a dry fraction. The liquid fraction of the digestate will be sent to a holding tank to allow settlement of any further suspended solids. The majority of the liquid digestate is transferred to the humidification system and the remainder is then held in holding tanks before being piped to Black Rock's WRP facility for processing. The Black Rock WRP is located at the same site as the proposed RRON facility. Sediments from the holding tank will be processed via the carbonisation plant into biochar.

In year 1 of the RRON operation, it is estimated that 23,360 tonnes of liquid digestate will be recycled via the humidification system and 5,450 tonnes will be piped to the Black Rock WRP.

4.3.3 Solid digestate

Dewatered (solid) digestate will be loaded using front end loaders into a digestate drying process, which involves arranging the digestate into windrows on a perforated concrete slab and blowing air through the material to remove moisture. This process will be conducted indoors with the building under negative pressure.

The dried digestate will be around 49% moisture content and will be loaded onto trucks from an enclosed area. The dried digestate will be carted in heavy rigid tipper trucks (approximate load of 30 tonne per truck). The trucks will have a cover over the digestate and watertight seals to prevent leakage. The trucks will cart the digestate to a local composting facility to blend it with green waste compost material. The compost facility will need to hold an EPA permission to accept the low risk digestate waste.

Prior to processing digestate via aeration the quantity of digestate is expected to be 32,250 tonnes (Year 1) and after aeration it is expected to be 24,000 tonnes (Year 1).

4.3.4 Biochar

Biochar will be produced from the carbonisation of the biosolids, bioprill and green/garden organics material described in section 2.3. In year 1 the facility is expected to produce between 5,070 to 6,700 tonnes of biochar. Biochar contains fixed carbon and mineral ash and can be used as a high-value product for agriculture and production of advanced sustainable materials. Barwon Water is exploring opportunities through research partnerships with Deakin University and RMIT for using biochar, knowing it can be helpful in a variety of applications, in both soil and non-soil applications. In years to come, it could also be used in applications as broad as carbon fibre materials, sustainable batteries and green construction. Its 'carbon-locking' property sets it apart from compost and conventional soil conditioners and fertilisers.

Due to the high carbonisation temperature and retention time, biochar is free from pathogens and E-coli. Chemical testing for biochar from a Mavitec (the carbonisation technology provider) reference plant is shown in Table 7. The reference plant involved carbonisation of a turkey manure feedstock. Results for the unprocessed dry turkey manure and fly ash concentrations are also shown in Table 7.

Table 7 Chemical testing

Analyte	Dry turkey manure/litter (mg/kg) – unprocessed	Biochar (mg/kg)	Fly ash (mg/kg)
Arsenic	<10	<10	<10
Copper	1826	1882	1938
Chromium	79	211	357
Lead	<5	<5	<5
Nickel	90	222	624
Manganese	2401	2478	2556
Strontium	356	351	358
Vanadium	13	<5	10
Zinc	2052	2044	2665
Chlorine	-	-	200

4.3.5 Fly ash

The carbonisation plant will produce small quantity of fly ash from the cleaning of the thermal oxidiser and blend chamber flue ducts. The cleaning process will be 12 to 24 hours in duration and will take place through an access door in the blend chamber. Upon removal, the fly ash should be manually loaded into large bags. Trials will be undertaken during commissioning to assess the time between cleaning cycles, but as a basic measure, the flue ducts will be cleaned once a month. The expected quantity of fly ash is approximately 2 m³ per month.

There is potential to recycle the fly ash by feeding it slowly into the carbonisation plant, and it will dissolve in biochar. Chemical testing of the fly ash will be undertaken during commissioning to assess if this is possible based on the concentrations of contaminants in the fly ash. If the fly ash cannot be recycled into the process it will be disposed to a facility licensed to accept the fly ash classified as RPW. The fly ash composition will generally correspond with the composition of the initial biomass and will have the same mineral content as the biochar. It has no special handling requirements.

Laboratory analysis of fly ash from a carbonisation reference plant that used a turkey manure feedstock is shown in Table 7.

4.3.6 Scrubber effluent (process water)

The air treatment train includes a wet scrubber system which will produce a process water (effluent) stream that can be reused as an ammonium sulphate liquid fertiliser product. Sulphuric acid (~2.9 kL/annum), sodium hydroxide (~1.8 kL/yr) and sodium hypochlorite (~5.4 kL/yr) are inputted as part of the scrubber systems and ammonia within the air stream is mixed with sulphuric acid and is washed with water to remove dust and heat in the air stream. The end product is process water with generally less than 3% ammonium sulphate and 97% water, with traces of dust. The concentration of ammonia differs based on the ammonia composition of the air stream, which for the proposed facility is anticipated to be less than 50 ppm.

The facility is expected to produce 60-75 m³/day or 21,900-27,400 m³ per annum of effluent, and depending upon the strength of this stream, may be able to be sold as an ammonium sulphate liquid fertiliser. If the effluent stream cannot be sold as a product it will be piped to Black Rock's WRP facility for processing.

Chemical testing data for scrubber effluent from a reference facility processing swine manure is provided in Appendix B. The data provided in Appendix B is indicative only and does not represent the RRON wastewater.

4.3.7 Spent activated carbon

The biogas treatment section of the PFAD will produce spent activated carbon pellets as a waste product. These will be sulphur laden and will be sent to a disposal facility licensed to accept this waste. It is anticipated that replacement frequency of the activated carbon pellets will be at a minimum of five years.

4.4 Further regulatory approvals

The RPW that will be reused from the RRON facility includes the biochar, solid digestate and potentially scrubber effluent from the carbonisation air pollution control system.

The Environment Protection Regulations 2021 regulate the reuse of RPW via different processes that are outlined below. BW will consult with EPA on the most appropriate pathway to reuse the solid digestate, biochar and scrubber effluent as part of a separate application process.

4.4.1 Digestate Designation

EPA Victoria has released a *Safe production and use of digestate guidelines*. The Designation for low risk digestate came into effect on 21 December 2023.

Digestate is classified as a reportable priority waste under the Environmental Protection Regulations 2021, however, EPA allows the classification of low risk digestate for composting or other secondary processing or use under the Designation. The Designation allows the producer to reclassify low-risk digestate as a priority waste if it meets the specifications of the Designation, based on demonstrating either:

- Process-based pasteurisation, which involves:
 - For digestate produced from low risk feedstocks:
 - $\geq 55^{\circ}\text{C}$ temperature during anaerobic digestion for ≥ 72 hours, or
 - Pre/post treatment at $\geq 70^{\circ}\text{C}$ temperature for ≥ 1 hour
 - For digestate produced from high risk feedstocks:
 - $\geq 55^{\circ}\text{C}$ temperature during anaerobic digestion for ≥ 72 hours, and
 - Pre/post treatment at $\geq 70^{\circ}\text{C}$ temperature for ≥ 1 hour
- Outcome-based pasteurisation, which involves risk assessment, selection of pathogen indicators, demonstrated risk reduction, monitoring, record keeping

Based on the guidelines, it is expected that the digestate produced at the RRON facility will comply with the Designation specifications as digestate from the RRON facility will be generated from the low risk feedstocks outlined in Appendix 1 (Table 4) of the Designation and the organic wastes processed via the PFAD will meet the pasteurisation of the Designation for low risk feedstocks requirements (due to thermophilic anaerobic digestion process at $\geq 55^{\circ}\text{C}$). The digestate generated is also expected to meet the chemical and physical contaminant limits listed in Appendix 1 of the Designation.

The expectation that the RRON facility will comply with the Designation specifications is on the basis that no elevated risk feedstocks (e.g., solid or liquid animal wastes) will be processed via PFAD. If the RRON were to process elevated risk feedstocks it would require a secondary pasteurisation process as outlined in the Designation and additional monitoring and controls would be implemented to provide assurance that the digestate generated is low risk (e.g., using the Outcome-based pasteurisation approach).

During commissioning, chemical and physical testing of the digestate will be undertaken to confirm it meets the specifications of the Designation. A digestate management plan will also be prepared to document procedures for monitoring the quality and use of the digestate.

4.4.2 A16 permit (supply and use of reportable priority waste)

This permit allows for a person in management or control of an RPW to use the waste themselves or to provide it to others for an end use/development of products.

Under this instrument, an upstream supplier holds a permit to supply RPW, the receiving users are exempt from the requirements to hold a permit provided they use the waste for the purposes outlined in the suppliers' permit. In short, a permitted supplier can provide RPW to a number of receiving users under a single permit.

Under this permit, the supplier still has the waste duties associated with RPW, including transport duties.

4.4.3 Waste designation

An alternative approach would be to reclassify the biochar or scrubber effluent such that it is no longer RPW. This removes the duties attached to RPW and opening potential pathways for use.

In order for reclassification to occur, a person in management of waste must apply for a specific designation seeking the reclassification of waste. EPA will make a case-by-case determination about whether it is appropriate to issue specific designations.

Facilities receiving the waste will need a Declaration of Use (DoU) in order to receive and use the waste. The DoU is a self-assessed declaration that supports the safe reuse and recovery of materials from low-risk waste. It is a short two-page form that does not require EPA approval, notification or tracking.

5. Waste systems and processes

The systems and processes to manage incoming feedstock and byproducts at the RRON facility are outlined in the sections below. A detailed description of the RRON facility processes is included in the DLA report.

5.1 Waste receival

All incoming waste loads will be inspected at various locations within the facility with the purpose of ensuring that the facility only accepts wastes it is licensed to accept. On entering the RRON facility, the organic waste delivery vehicles enter a weighbridge where the weight of the vehicle is recorded. The recorded weight is displayed on the scale terminal, and delivery notes generated. The truck scale will be equipped with an automatic number plate recognition or a terminal for self- registration. The same generally applies to vehicles when leaving the facility, except for vehicles already included in the system that don't need to be weighed upon exit.

Wastes will be unloaded into designated receival bunkers and will then be visually inspected prior to being loaded into the process. Systems and procedures for recording and inspecting incoming waste loads will be documented in the RRON facility Operational Environmental Management Plan.

5.1.1 PFAD feedstock

FOGO material will be received in the pre-treatment building in a dedicated bunker ready for pre-treatment (refer section 5.2). Solid organic C&I wastes will be unloaded via tipping into the same dedicated bunker. Following pre-treatment processes, a crane will then feed the digester hopper, and via a sequence of conveyors, will feed the digester with a FO-rich stream.

Liquid C&I waste is received via road tankers into the designated liquid C&I bunded off-load bay where it is pumped to a holding tank before being fed directly to the anaerobic digestor.

5.1.2 Carbonisation feedstock

The GO-rich stream separated from the FOGO during pre-treatment will be stored in a bunker, next to a separate bunker for storing biosolids receivals.

Bulk green waste material will be received in separate bunker located next to the FOGO bunker. Following pre-treatment (secondary shredding of the bulk green waste) it will be loaded into the GO-rich stream bunker awaiting processing via carbonisation.

A crane operating in this area will load the GO-rich stream (including bulk green waste) and biosolids into a mixing hopper for carbonisation processing.

5.2 FOGO pre-treatment

The FOGO waste is unloaded from the delivery trucks within the main process building and loaded via front loader into the pre-processing train which comprises the following elements. FOGO waste is transferred by the front-end loader from the FOGO Drop-off Bunker into a variable speed drive feed hopper which then feeds the slow speed pre-shredder via a transfer conveyor. The pre-shredder shreds the FOGO to less than 250 mm. The shredded material is then transferred by conveyor to the screen to separate FOGO into +/- 50mm sizing.

The undersized, food rich organics (FO) <50 mm stream is transferred via conveyor to the FO bunker via the sorting cabin where contamination removal can be undertaken. An automated overhead gantry crane operating above the FO bunker will feed the FO material from the bunker into the Digestor Feed Hopper. From the hopper the FO will be transferred via conveyor to the digester.

The oversized > 50 mm material from the screen is also transferred via conveyor to the sorting cabin where contaminants are manually removed and collected in an 'Oversized Contamination Bunker'. The sorting cabin can accommodate up to eight pickers on the oversized line and has suitable air control systems, amenities and safe access for the workers.

Post the sorting cabin, the oversized > 50 mm material passes under a ferrous separator to remove any ferromagnetic materials to ensure all ferrous material is removed prior to further shredding. Post ferrous removal, the > 50 mm fraction is directed to secondary shredder that is designed to reduce all the organics to a < 50 mm size.

The secondary shredder can also be accessed via front end loader to allow woody organics to be shredded to < 50mm for subsequent feed to the Carbonisation Plant.

5.3 Waste storage

Effective stockpile management is a critical aspect of fire safety in an organic processing facility; poorly managed stockpiles can create a significant fire risk, potentially leading to damage to the facility, harm to personnel and negative impacts on the environment.

The Environment Protection Authority Victoria (EPA VIC) Guidelines for *the Management and storage of combustible recyclable and waste materials* (CRWM guidelines) provides content for duty holders (those under an EPA licence or permit) on how to fulfil their obligations in ensuring that they identify their risks and practical measures that can be taken to minimise human health and the environment from fire.

A Fire Safety Study has been prepared (included as Appendix L of the DLA) which outlines for stockpile management including physical dimensions of stockpiles and separation distances in accordance with the CRWM guidelines.

5.4 Byproducts

5.4.1 Digestate

The solid digestate will be dewatered using a screw press then stockpiled in a bunker located directly under the screw press. Following this, front end loaders will move the digestate to the indoor digestate drying areas, where it will be maintained in windrows for approximately 1.5-2 weeks before being carted offsite by heavy rigid tipper trucks to a local composting facility that holds an EPA permission to accept the low risk digestate waste.

5.4.2 Biochar

The quenched biochar will be bulk bagged and stored on racks inside the carbonisation building prior to transportation out of the facility. Based on experience from other facilities around 800 kg of biochar can be stored in bags sized 1.2mx1.2mx1.6m. The carbonisation building has been sized to provide adequate indoor storage racks for the biochar bulk bags.

5.4.3 Scrubber effluent

The scrubber effluent will be contained in a holding tank, in preparation for transport out of the facility. Alternatively, it will be piped to the Black Rock WRP for processing.

The facility is expected to produce 75 m³/day or 27,400 m³ per annum of effluent.

5.4.4 Fly ash

The small quantities of fly ash will be contained inside the carbonisation building. As described in section 4.3.5 fly ash will be either recycled by slowly feeding it into the carbonisation plant or disposed to a facility licensed to accept the RPW.

6. Waste duties

The waste duties from the EP Act 2017 and EP Regulations 2021 are outlined in Table 8. The table comments on the relevance of each waste duty to the RRON facility and how the RRON will achieve compliance.

Table 8 Waste duties

Duties	Requirements	RRON facility relevance and compliance
Duties of persons depositing industrial waste	Must send industrial waste to a lawful place and not illegally dump it.	Industrial wastes generated at the facility (see Table 6) will be deposited at a lawful place (refer section 4.1)
Duties of persons receiving industrial waste ('lawful place')	Must only receive industrial waste if the place or premises is authorised to receive it.	BW is seeking a Development Licence to build and commission the RRON facility and assuming this is approved by EPA, BW will seek approval for an Operating Licence from EPA to operate the facility and the receive incoming wastes identified in Table 5.
Duties of persons managing priority waste	Must: <ul style="list-style-type: none"> – Classify the waste – Contain the waste, to prevent escape or contamination – Isolate the waste, to ensure resource recovery remains practicable – Provide information regarding the waste to the next person in the supply chain so that they can meet their duties 	The priority wastes and RPW that the RRON facility will receive and generate are presented in Table 5 and Table 6, respectively. Priority waste and RPW will be isolated and contained at the facility to prevent contamination to the environment and human health.
Duty to investigate alternatives to waste disposal	Must take all reasonable steps to identify and assess alternatives to waste disposal.	As outlined in section 4.1 the RRON facility will be reusing the biochar and ammonium sulphate effluent byproducts produced. Fly ash will also be potentially recycled through the carbonisation process.
Duty to notify of transaction in reportable priority waste	Must inform EPA every time a reportable priority waste is exchanged, through EPA's electronic waste tracker.	Any incoming and outgoing reportable priority wastes (listed in Table 6) at the facility will be reported in EPA's electronic waste tracker.
Duty to notify of transaction in reportable priority waste	Must not transport or cause or allow the transportation of reportable priority waste other than in accordance with a permission.	As outlined in section 4.1, RPW will be managed in accordance with the EP Act and EP Regulations. RPW transported to other licensed sites will be transported in a vehicle registered to transport the waste.

SOLID FERTILISER ANALYSIS REPORT

1 sample supplied

on 2/11/2021 . Lab Job

Analysis requested by Accounts Payable.

PO Box 9129 PICTON WA 6229

	Sample ID:	Sample 1
	Sample Type:	Bioprill
Parameter	Method reference	M3102/1
Nitrogen (%)	LECO Trumac Analyser- Inhouse S4a	6.65
Phosphorus (%)	Nitric/Hydrochloric Acid digest - APHA 3125 ICPMS	2.98
Potassium (%)	Nitric/Hydrochloric Acid digest - APHA 3125 ICPMS	0.99
Sulfur (%)	Nitric/Hydrochloric Acid digest - APHA 3125 ICPMS	0.67
Carbon (%)	LECO Trumac Analyser- Inhouse S4a	38.2
Calcium (%)	Nitric/Hydrochloric Acid digest - APHA 3125 ICPMS	1.05
Magnesium (%)	Nitric/Hydrochloric Acid digest - APHA 3125 ICPMS	0.76
Sodium (%)	Nitric/Hydrochloric Acid digest - APHA 3125 ICPMS	0.27
Copper (mg/kg)	Nitric/Hydrochloric Acid digest - APHA 3125 ICPMS	331
Zinc (mg/kg)	Nitric/Hydrochloric Acid digest - APHA 3125 ICPMS	549
Manganese (mg/kg)	Nitric/Hydrochloric Acid digest - APHA 3125 ICPMS	115
Iron (mg/kg)	Nitric/Hydrochloric Acid digest - APHA 3125 ICPMS	11,700
Boron (mg/kg)	Nitric/Hydrochloric Acid digest - APHA 3125 ICPMS	59
Molybdenum (mg/kg)	Nitric/Hydrochloric Acid digest - APHA 3125 ICPMS	5.12
Cobalt (mg/kg)	Nitric/Hydrochloric Acid digest - APHA 3125 ICPMS	3.58
Silicon (mg/kg)	Nitric/Hydrochloric Acid digest - APHA 3125 ICPMS	1,380
pH	Rayment & Lyons 2011 - 4A1 (1:5 Water)	5.98
Electrical Conductivity (dS/m)	Rayment & Lyons 2011 - 3A1 (1:5 Water)	6.86
Moisture (%)	Inhouse 92 (105°C)	11.14
Aluminium (mg/kg)	Nitric/Hydrochloric Acid digest - APHA 3125 ICPMS	6,747
Selenium (mg/kg)	Nitric/Hydrochloric Acid digest - APHA 3125 ICPMS	6.2
Cadmium (mg/kg)	Nitric/Hydrochloric Acid digest - APHA 3125 ICPMS	0.7
Lead (mg/kg)	Nitric/Hydrochloric Acid digest - APHA 3125 ICPMS	10
Arsenic (mg/kg)	Nitric/Hydrochloric Acid digest - APHA 3125 ICPMS	14
Chromium (mg/kg)	Nitric/Hydrochloric Acid digest - APHA 3125 ICPMS	52
Nickel (mg/kg)	Nitric/Hydrochloric Acid digest - APHA 3125 ICPMS	18
Mercury (mg/kg)	Nitric/Hydrochloric Acid digest - APHA 3125 ICPMS	0.6
Silver (mg/kg)	Nitric/Hydrochloric Acid digest - APHA 3125 ICPMS	2.3
