1.0 Introduction

This report has been prepared by KLM Spatial on behalf of Murphy Trust No.1 to assess stormwater management requirements for the proposed development of 280 Evans Road Cranbourne West.

The assessment has been conducted by experienced engineers from KLM Spatial with consideration to the existing conditions, proposed site usage and layout, surrounding drainage scheme and relevant feedback/advice from catchment management authorities.

The report considers the following elements of stormwater management relevant to development of the site:

- Stormwater Catchments and Hydrology
- Stormwater Quantity & Quality Management
- Proposed Drainage Network and Hydraulics

2.0 Site and Surrounds

The existing site at 280 Evans Road Cranbourne West is approximately 23.28ha in size. It is currently a rural residential property with a singular dwelling. The remainder of the property is used for grazing.

The site is bound by an Ausnet Terminal Station to the east, Evans Rd to the west, Thompsons Rd to the north and Breen's Road to the south. Thompsons Road has recently been upgraded by VicRoad's which includes the installation of Melbourne Water Main Drainage Pipelines.

The site generally grades to the north west. There is over 5m fall across the site with an average grade just under 1in150. There are a number of undulations on the site, including a ridge in the south eastern corner. There is an existing low point in the north of the site conveying flows from the AusNet site to Evans Road. Feature survey can be found in *Appendix A.*

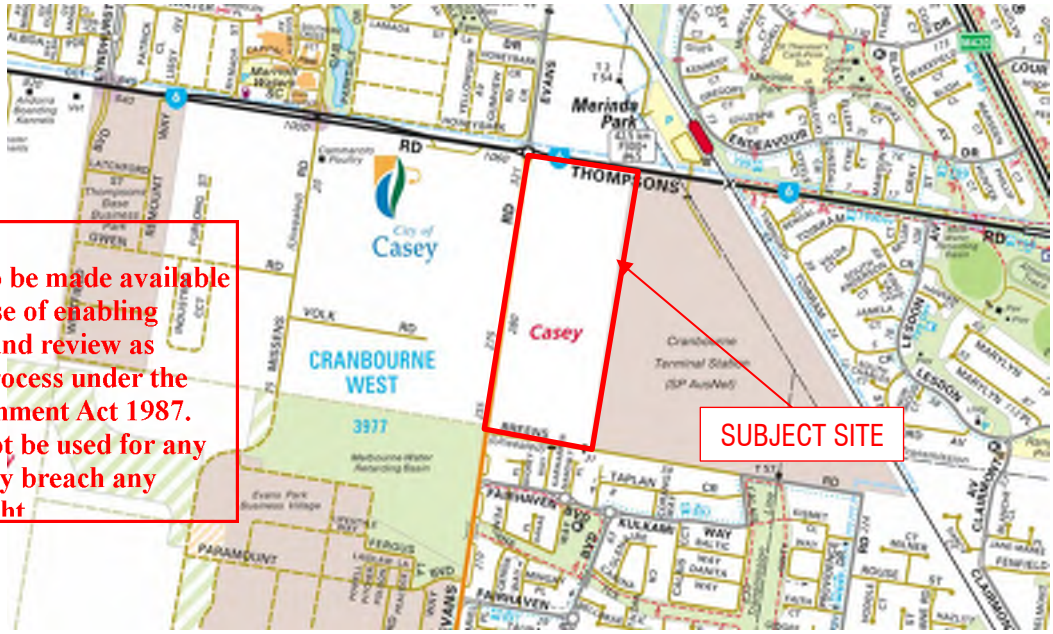

Figure 2: Aerial Image of Site and Surrounds

3.0 Proposed Development

The subject site is proposed to subdivide the site for industrial and commercial use. The ultimate development will combine a mixture of uses including, but not limited to warehousing and large-scale commercial/retail.

Stages 1-3 splits the site into 2 large superlots and includes the construction of trunk infrastructure to service the ultimate development of the site. Master plan can be found in *Appendix B*.

In the future these superlots will be further developed, either as an owner's corporation with shared access roads or by subdivision. To assist the assessment for stormwater requirements, the below figure shows a likely ultimate layout for the site in blue subject to further refinement of development on that land.

The report presumes a staged drainage strategy for the site to cater for development of land south of Rangebank Drive in advance of land north of Rangebank Drive.

Figure 3: Proposed Layout Plan

The subject site falls within Melbourne Waters Lyndhurst Drainage Scheme (DSS 0711). Please find extract of the scheme below, with full scheme included within *Appendix C*.

The site ultimately drains to the wetland on the north of Thompsons Road within the Marriot Waters Estate. Construction of this wetland is completed and the wetland is well established.

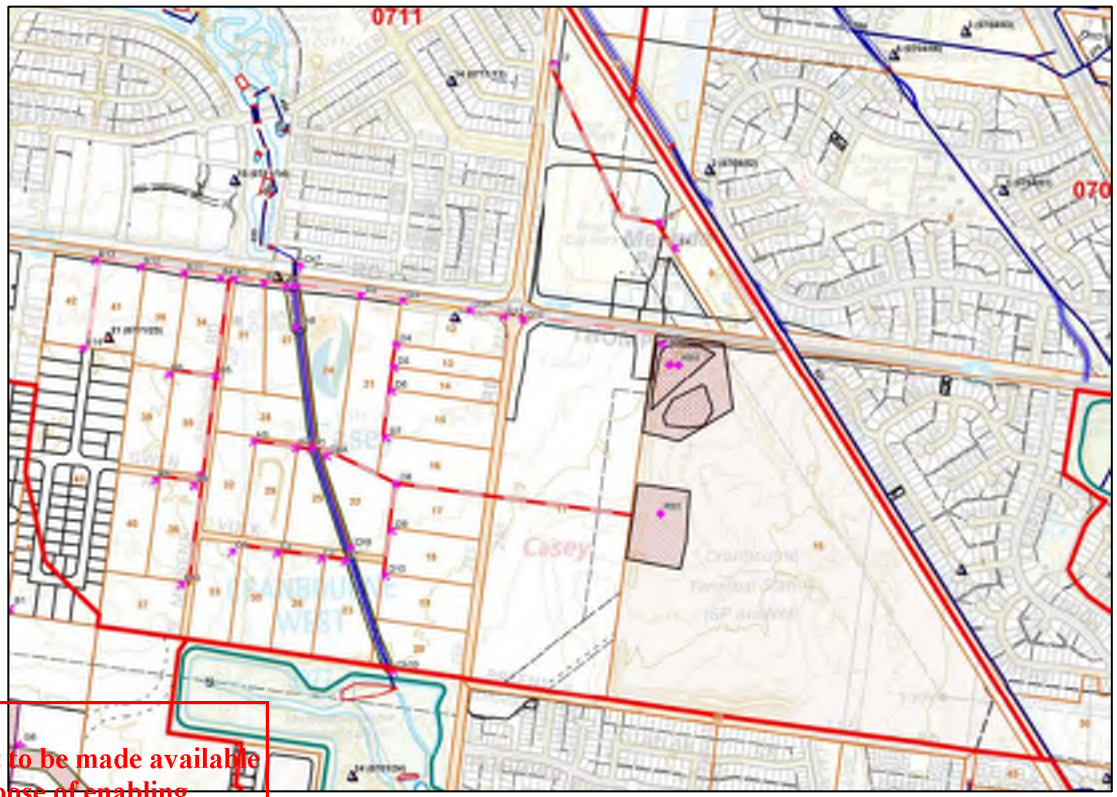
The Northern portion of the site will drain to scheme pipeline B1-D13. Construction of this pipeline was completed recently as part of the Thompsons Road Upgrade Project, including the construction of culverts beneath Thompsons Road linking the Pipeline and Cranbourne Outfall Drain to the wetland on the northern side. Construction plans for the pipeline are included in *Appendix D.*

The southern portion of the site will drain to scheme pipeline H1-RB5 which will in turn connect to the Cranbourne Outfall Drain. The Cranbourne Outfall Drain is currently very shallow and narrow and not suitable for the connection of additional flows. Timing for the development of these properties to the west of the subject site is unknown, but not anticipated in the near future. It has been determined it will not be feasible to acquire land to upgrade the Cranbourne Outfall Drain or install the proposed pipeline through these properties at this point in time.

There are no external catchments from the south of the subject site. Flows are being diverted around the site to the Evans Road Retarding Basin and Wetland located on the south west corner of the Breen's Road and Evans Road intersection. There are no external catchments to the west or north as this area grades away from the subject site.

External catchments will need to be allowed for the AusNet Terminal Station to the east of the site. The site is currently largely impervious, with small hard stand areas for electrical infrastructure only. Should the site be developed in the future, retarding basins have been allowed under the scheme to retard flows back to existing. As such, it can be assumed only existing flows will need to be allowed from this site.

Figure 4: Lyndhurst Drainage Scheme (DSS 0711)



As the drainage scheme will provide hydraulic capacity and treatment to best practise for the site, contributions will be payable accordingly. Calculation of applicable contributions have been calculated as per the below.

Contributions payable on the electrical easement are subject to final land use. For the purpose of this report its has been assumed as developed land, however, if this land is encumbered and unusable, contributions would not be payable on this area.

4.0 Catchments and Hydrology

An analysis has been made to determine appropriate catchments for the site to inform hydrological calculations and assess both existing and design flows.

4.1. Existing Impervious

The critical factor in determining the existing runoff from a site is the imperviousness.

The impervious area of the subject site is negligible. As such a minimum of 20% will be adopted in line with EDCM standards for rational method calculations.

The impervious hardstands within the AusNet Terminal Station were measured as a total of 5.5ha. The total site is 48.46ha, giving an imperviousness of 11%. As such, the minimum 20% impervious will be adopted for rational method calculations as above.

Figure 6: Existing Impervious Areas

4.2. Minor Storm Event

The minor drainage system will consist of a subsurface pipe network designed to capture and convey all stormwater runoff generated from the catchment for rainfall events up to and including the 10% AEP storm for industrial catchments. The system will be owned and maintained by council and designed in accordance with the Engineering Design and Construction Manual (EDCM).

There are 4 major catchments which have been identified relevant to the development of the subject site. The rational method has been utilised to calculate existing and design flows for these catchments. As the AusNet site will be retarded back to existing, the developed flows from this site are not applicable.

4.3. Major Drain Network

The major drainage system will utilise a combination of pipelines and the road network to safely convey gap flows between the 10% and 1% AEP storm overland in accordance with DELWP Guidelines for Development in Flood Affected Areas.

Catchments for the major storm even will be the same as those for the minor event above.

5.0 Proposed Drainage System

The drainage system for the development will be designed to safely convey stormwater runoff and provide protection from flooding in a 1% AEP storm event.

5.1. Pipelines

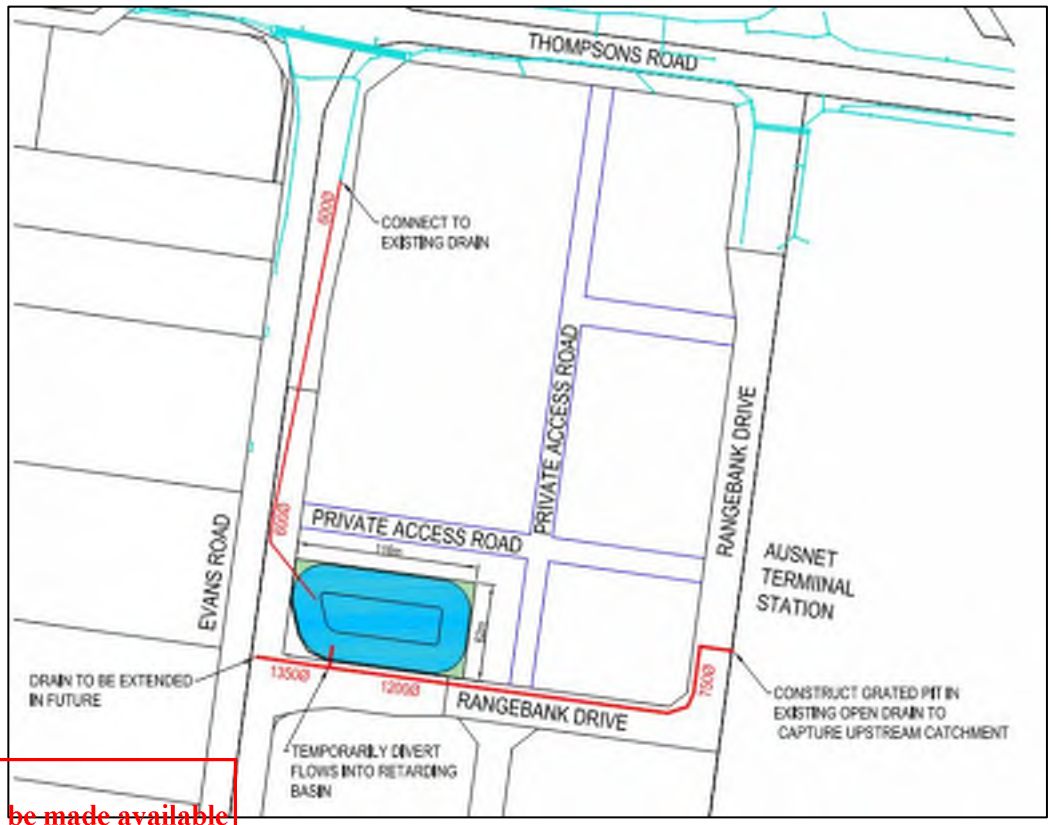
The northern catchment (A&C in the above) will drain to the existing Thompsons Road drainage system. The Melbourne Water Pipeline in Thompsons Road has sufficient capacity to cater for the major storm event (1% AEP). Construction plans for the pipeline have been provided within *Appendix D*. As hydraulic calculations for the pipeline are not available, the pipeline has been remodelled to confirm its hydraulic capacity. Please find calculations included in *Appendix E.*

The southern catchment (B&D in the above) will drain to the proposed Melbourne Water scheme pipe through the centre of the site. As it is not feasible to construct the proposed drainage outfall for this catchment, a temporary retarding basin will be required at the boundary of the site to limit flows to existing.

Functional Design for the proposed pipeline gives a size of 750-1350mm dia. and a length of 340m, please find functional design for the pipe included in *Appendix F*. A pit at the boundary of the property will be temporary blocked, diverting flows into the required temporary retarding basin. A temporary 600mm dia. outfall pipe will be constructed from the retarding basin and connect to the existing 600mm dia. drain in Evans Road.

Once the proposed scheme outfall to the west is completed, the retarding basin will be backfilled, the temporary outfall drains decommissioned and the plate in the diversion pit removed to allow the pipe to perform in its ultimate functionality.

Figure 8: Proposed Drainage System



KLM SPATIAL

All works relating to the permanent DSS pipeline will be reimbursable under the drainage scheme. Sacrificial temporary works will be at the cost of the developer.

5.2. Stormwater Retention

Using Boyd's formula, a required storage volume has been calculated to retain flows in the 1% AEP storm back to a sufficient level which will allow discharge into the existing drainage. As the existing drainage cannot cater for the existing 1%AEP storm, we have had to over-size the proposed retarding basin to provide an outflow which can fit into the existing pipe.

A 0.7ha area has been allocated which will cater sufficiently for the below required storage. The size and shape of the proposed basin will be refined in subsequent design stages.

5.3. Road Network

The northern catchment will utilise the Thompsons Road pipeline to convey storms up to and including the 1% AEP. As such, Thompsons Road will be protected and there will be no overland flow on the road in major storm events.

The southern catchment will utilise the Rangebank Drive Road reserve to convey gap flows between the 10% AEP capacity of the proposed pipeline and the 1% AEP major storm event.

6.0 Water Quality

It is required that stormwater quality measures are applied to this site in accordance with the Clause 44 of the State Environmental Protection Policy (SEPP).To meet minimum SEPP requirements, developments should meet the Best Practice Environmental Management Guidelines for Urban Stormwater, available from CSIRO Publishing. Best practice stipulates the following outcomes for both construction, and post-construction phases of the project:

Construction Phase

Pollutant type	Receiving water objective	Current best practice performance objective
Suspended solids	Comply with SEPP	Effective treatment of 90% of daily run-off events (e.g. <4 months ARI). Effective treatment equates to a 50 percentile suspended solids concentration of 50 mg/L. This can be achieved by installing a sediment ponds to remove 95% of sediment down to 125 µm for a 1 year ARI.
Litter	Comply with SEPP	Prevent litter from entering the stormwater system. This requirement extends until 95% of the lots are constructed or a period of two years has passed.
Other pollutants	Comply with SEPP	Limit the application, generation and migration of toxic substances to the maximum extent practicable.

Post-construction Phase

Pollutant type	Receiving water objective	Current best practice performance objective
Suspended solids (SS)	Comply with SEPP (not to exceed the 90th percentile of 80 mg/L) (1)	80% retention of the typical urban annual load
Total phosphorus (TP)	Comply with SEPP (base flow concentration not to exceed 0.08 mg/L) (2)	45% retention of the typical urban annual load
Total nitrogen (TN)	Comply with SEPP (base flow concentration not to exceed 0.9 mg/L) (2)	45% retention of the typical urban annual load
Litter	Comply with SEPP (No litter in waterways) (1)	70% reduction of typical urban annual load (3)
Flows	Maintain flows at pre-urbanisation levels	Maintain discharges for the 1.5 year ARI at pre-development levels

Treatment of stormwater runoff from the development will be treated to best practise standards by the treatment infrastructure constructed downstream under the Lyndhurst DSS (0711). No further treatment will be required on site. All treatment assets are existing so no interim measures will be required.

7.0 Conclusion

This report makes the following general conclusions:

- The proposed drainage strategy for the site will safely convey stormwater runoff and provide protection from flooding in a 1% AEP storm event.
- The existing Melbourne Water scheme pipeline within Thompsons Road has sufficient capacity to cater for the development of the northern catchment of the subject site in storms up to and including the 1% AEP.
- Proposed Melbourne Water scheme pipeline through the centre of the subject site will be constructed as part of this development. As it is not feasible to construct the scheme outfall for this catchment, a temporary retention basin has been proposed to retard flows back to a suitable level for storms up to the 1% AEP.
- Sufficient treatment is provided downstream of the subject site by the existing Marriot Waters Wetland under the Melbourne Water Drainage Scheme to treat flows from the development to best practise.

REINFORCEMENT

R1. REINFORCEMENT SHOWN ON THE DRAWINGS IS REPRESENTED DIAGRAMMATICALLY AND NOT NECESSARILY SHOWN IN TRUE PROJECTION. FOR CLARITY, BAR LOCATIONS MAY BE EXAGGERATED.

R2. SPLICES IN REINFORCEMENT SHALL BE MADE ONLY IN THE POSITION SHOWN ON THE DRAWINGS OR AS OTHERWISE APPROVED BY THE ENGINEER AND THE PRINCIPAL. UNLESS ALTERNATIVE OR EXTRA LOCATIONS ARE APPROVED IN WRITING BY THE ENGINEER AND THE PRINCIPAL. WHERE THE LAP LENGTH IS NOT SHOWN IT SHALL BE SUFFICIENT TO DEVELOP THE FULL STRENGTH OF THE REINFORCEMENT. BAR LAPS IN MILLIMETRES ARE TO BE AS SHOWN BELOW UNLESS SHOWN OTHERWISE:
